Dear Hiring Team at SBS,

I am applying for the Senior Product Owner role within your DE AI organisation. My background covers 13 years of product ownership in regulated industries, defence AI, public-sector analytics, insurance, healthcare, payments and fintech, with a deliberate recent focus on AI and data platform delivery. The combination of backlog discipline, AI deployment experience and financial services domain knowledge you are describing maps directly onto what I have been doing.

On the AI and platform side: at Rohde & Schwarz I owned the internal AI and data platform for the FCAS European programme, managing a cross-functional team of 15+ engineers and data scientists. I introduced GitOps rollouts with ArgoCD that cut deployment time from days to 30 minutes, instrumented competing workflows to redirect strategy, and increased pipeline runs by 200% by making a data-driven call against a politically popular but unused UI. That is the kind of evidence-based prioritisation and engineering-ready spec work the DE AI backlog requires.

On the fintech and payments side: I co-founded Kvitt Payment Solutions, a mobile P2P payments product built inside the girocard ecosystem and later acquired and operated by Sparkasse. I have direct product experience designing payment flows, handling PSP integration edge cases and navigating the compliance constraints that come with operating inside a bank's infrastructure. I understand the difference between a payments feature that works in a demo and one that clears audit.

The post-launch feedback loop responsibility in this role, adoption, quality, drift, iteration, is one I take seriously rather than treating it as a monitoring afterthought. At the Bundesagentur für Arbeit I instrumented a national labour-market analytics platform, introduced Dagster and dbt to eliminate manual data-handling steps, and built evaluation tooling so the team could detect and correct data quality drift without hand-holding. The same discipline applies to LLM outputs: you need acceptance criteria that cover the probabilistic case, guardrails that trigger on drift, and a structured loop back into the backlog.

I work well at the interface between business stakeholders, AI Platform teams and engineering squads. I leave ego out of prioritisation decisions, document trade-offs transparently, and close the loop after launch rather than moving immediately to the next feature. That is the posture this role needs, and it is how I operate.

I would welcome a conversation about how my experience maps to the specific use cases in the DE AI backlog.

Best regards, *Philipp Hilbert*
