

Philipp Hilbert. *WealthTech Product Lead building B2B wealth platforms from zero.*

Positioning, 13 years owning regulated B2B SaaS products across fintech, defence AI and insurance, now targeting wealth-platform inception.

Dear Hiring Team at Alpheya,

Wealth technology platforms are among the most demanding B2B SaaS products to build: the domain combines real-time transaction integrity, regulatory compliance, and user journeys that must work for both sophisticated institutional operators and the end affluent investor. The fact that Alpheya is building this from scratch, with a 12-month runway to a live banking client, and with BNY Mellon and Lunate as institutional anchors, is what drew me to this role specifically rather than to the broader WealthTech market.

My background is 13 years of product ownership across regulated B2B and B2B2C environments, fintech, defence AI, public-sector analytics, insurance SaaS, and healthcare. At Kvitt Payment Solutions I built a mobile P2P payments product from zero and took it to acquisition by Sparkasse inside the girocard ecosystem, which taught me how financial transaction flows, ledger integrity, and regulatory-grade audit requirements translate from a whiteboard into shipped software. At EMIL Group I inherited a burning 18-person delivery organisation, restructured it into three focused teams, and shipped the Claims Center, a product with no predecessor, while simultaneously rebuilding client trust. That pattern, entering an early-stage, high-stakes product environment and establishing execution discipline quickly, is what Alpheya's first-client timeline demands.

On the technical side, I work directly with engineering to define API contracts before the first consuming team builds against them, specify non-functional requirements across performance, reliability and data integrity, and instrument telemetry as part of the brief rather than as an afterthought. At Rohde & Schwarz I introduced GitOps delivery with ArgoCD that cut rollout time from days to 30 minutes on a multinational AI platform. At the Bundesagentur für Arbeit I introduced Dagster and dbt to a bare-metal ETL environment, reducing quarterly data-update time by 75%. These are the kinds of structural decisions that make or break a platform's ability to evolve quickly, exactly what a WealthTech product in its first year needs to get right.

I use AI tooling as a standard part of how I work, not as a talking point: Claude Code for in-repo specification and edge-case generation, Cursor and GitHub Copilot for engineering pairing, Lovable for front-end prototyping, and n8n for agentic workflow design. This is documented practice, not a slide claim. The posting's requirement for active, demonstrated use of AI coding and product tools describes how I already operate daily.

I am genuinely excited about the Abu Dhabi location and the Gulf market context. The opportunity to own the product roadmap spanning multi-asset trading, DPM, and omnichannel journeys for a platform that will define how HNW and UHNW investors are served through regional banks is not a role that comes around often. I would welcome the chance to discuss how my background maps to Alpheya's first-year priorities.

Best regards, *Philipp Hilbert*
