Dear Alpheya team,

I am applying for the WealthTech Product Lead position. Alpheya's premise, a greenfield B2B wealth platform backed by BNY Mellon and Lunate, targeting the Gulf's affluent and UHNW segments with DPM, robo-advisory, and omnichannel journeys, is one of the more compelling product briefs I have read this year. The combination of institutional credibility, meaningful capital, and a genuinely underserved regional market is rare; so is a posting that explicitly asks for someone who defines API documentation before the first consuming team builds against it.

That last requirement is where I want to spend a moment, because it describes something I consider non-negotiable rather than a differentiator. At Rohde & Schwarz I owned an internal AI and data platform for the FCAS European programme. The platform's early lifecycle was slowed by teams building against undocumented interfaces; I established a contract-first approach, REST API schemas reviewed and signed off before any downstream team started a sprint, and that single change cut integration rework by more than half. The same instinct drove my Claims Center delivery at EMIL Group: no line of code was written before we had agreed on what success looked like, what was explicitly out of scope, and which decisions had already been made. These are not process preferences; they are the mechanics that make a platform product defensible at scale.

On the wealth domain itself: I have shipped in fintech since founding Kvitt Payment Solutions in 2013, a mobile P2P group payment product that was acquired and operated by Sparkasse inside the girocard ecosystem. I understand payment ledger mechanics, the operational reality of regulated transaction flows, and the trust dynamics of a B2B2C model where the bank's risk appetite governs what the end investor can see or do. I have not shipped a full DPM engine or robo-advisory product, and I say that clearly rather than dress it up. What I bring is the ability to read a domain quickly, the technical depth to hold an honest conversation with quant and engineering teams, and a track record of taking complex regulated products from concept to production under time pressure, the Claims Center at EMIL went from concept to live in one quarter with no precedent in the organisation.

The AI-native requirement is one I meet in practice, not as a talking point. I use Claude Code and Cursor daily for specification work, edge-case generation, and rapid prototyping. I have designed and shipped agentic workflows using n8n, and I built construct8, a two-sided B2B marketplace, largely alone using LLM agents across the entire funnel. For a platform like Alpheya's, where the product surface spans web, mobile, and API integrations for bank clients, AI tooling shortens the spec-to-validation loop considerably; I treat that as a competitive obligation, not an optional upgrade.

I am an EU citizen, based in Berlin, and actively targeting the UAE, Abu Dhabi is a positive fit, not a location compromise. I can be on-site in the Gulf and am ready to relocate. I would welcome a conversation about the roadmap, the current team setup, and where the most acute friction sits today.

Best regards, *Philipp Hilbert*
