Dear Hiring Team,

Thirteen years of product ownership in regulated environments, defence AI, public-sector analytics, healthcare, insurance, fintech, has shaped one persistent conviction: government and public-sector technology is the hardest and most consequential domain in which to build digital products well. Not because the technology is more complex, but because the accountability is. SLAs are not commercial hygiene; they are public commitments. Governance forums are not bureaucratic friction; they are the mechanism through which civil servants remain answerable. I am not frustrated by structured approval environments, I rely on them.

The role you are describing matches the work I have been doing. At Bundesagentur für Arbeit I owned a national labour-market analytics platform that served policymakers and researchers across Germany. I acted as the main product contact for internal government stakeholders, ran requirements workshops, represented the product in governance reviews, and reduced data update cycle times by close to 75% by introducing Dagster and dbt into a pipeline that had been hand-held through every quarterly import. Simultaneously I migrated the system from bare metal into containers without interrupting service continuity. At Rohde & Schwarz I led the AI and data platform for the FCAS European programme, a multinational, multi-stakeholder environment with strict security and traceability requirements, and reduced deployment lead time from days to thirty minutes through GitOps delivery with ArgoCD.

The platform convergence mandate in your posting is where I believe I can contribute most immediately. I have done this before: at Bundesagentur für Arbeit I consolidated fragmented ETL workflows onto a single governed platform; at EMIL Group I restructured a fragmented eighteen-person delivery organisation into three focused teams so that different insurance product lines could share engineering capacity rather than compete for it. The principle scales directly to the challenge of bringing multiple government clients onto shared foundations. The bottleneck is usually not the technology, it is getting the first shared data contract agreed and holding the line on scope when each client believes their requirements are unique.

On AI and automation: I work with LLM agents and agentic workflows daily, not as a pilot curiosity but as a delivery tool. I understand the constraints that apply in a government context, privacy, data residency, explainability requirements, audit trails, and I have operated inside EU AI Act and GDPR frameworks. My side project, construct8, demonstrates what responsible AI automation inside a trust-sensitive context looks like when the PM is also the one writing the integration: an anonymity-until-payment marketplace running on LLM agents, with funnel analytics in SQL and no engineering team behind me.

I would be glad to discuss the specific products in your portfolio and where you see the greatest pressure on the roadmap right now. Abu Dhabi is one of the locations I am actively targeting, and I am available to relocate on short notice.

Best regards, *Philipp Hilbert*
