Dear Hiring Team at Bybit,

Notification platforms fail in a predictable way: they start as a convenience for one team, grow into a shared channel that every business unit treats as free, and end up as a channel users tune out or opt out of entirely. Fixing that requires more than a better send-time model, it requires a governance layer, a consent architecture, and a measurement framework that the whole organization trusts. That is the problem your posting describes, and it is the kind of platform product work I have spent the last several years doing.

At Rohde & Schwarz I owned an internal AI and data platform for the FCAS programme and led a cross-functional team of 15 engineers and data scientists. The hardest part was not the technical architecture, it was building a governance mechanism that prevented 15 teams from each optimising their own slice of the platform at the expense of the whole. I instrumented competing workflows, killed the beautiful UI that recorded zero production clicks, and redirected the roadmap based on what the data actually showed. That discipline, measure first, prioritise second, ship third, is what I would apply to Bybit's communication calendar and frequency control layer from day one.

At the Bundesagentur für Arbeit I owned a national labour-market analytics platform and served as Deputy IT Security Officer. That role required me to hold consent management, data governance, and delivery velocity in the same hand simultaneously, the same balance your posting calls for when it asks for someone who can coordinate across Engineering, Data, Compliance, and Operations without losing forward momentum. I integrated Dagster and dbt into the ETL pipeline, migrated a bare-metal system into containers, and ran a full UI relaunch inside the same delivery window, saving roughly 75% of the time per data update cycle.

My crypto and fintech context is not superficial. I co-founded Kvitt Payment Solutions, a mobile group-based P2P payments product that was acquired by Sparkasse and operated inside the girocard ecosystem. I have eight years of hands-on crypto experience across CEX and DEX venues, Hyperliquid, Jupiter, 1inch, Across Protocol, including perpetual futures, DEX aggregation, and cross-chain bridging. I understand how Bybit's users think about money, trust, and notification fatigue in ways that a PM without crypto exposure simply cannot replicate from a job description. I am also building my own backtesting engine and trading bot infrastructure, which gives me direct intuition for the kind of event-triggered, data-driven decision logic your engagement platform needs to support.

The AI-powered personalization capabilities in your roadmap, optimal send-time prediction, intelligent segmentation, personalized content generation, are areas where I have moved from experimentation to production. I use Claude Code, GitHub Copilot, Cursor, and n8n daily, not as productivity novelties but as delivery infrastructure. I can sit with your data scientists and your engineers and have a substantive conversation about how to instrument, evaluate, and govern an AI-powered messaging layer rather than just signing off on someone else's proposal.

I would welcome the chance to discuss how my platform governance experience and crypto-native context translate into immediate value for the notification control roadmap.

Best regards, *Philipp Hilbert*
