Dear Hiring Team,

I am writing to apply for the Technical Product Owner role at your AI-native wealth management and trading platform. The combination of FIX protocol integration, real-time and asynchronous product design, and the explicit expectation of hands-on AI-assisted prototyping makes this one of the more technically honest product briefs I have read, and an unusually good fit for the way I actually work.

My thirteen years of product ownership span regulated B2B fintech, defence AI platforms, public-sector data infrastructure, and healthcare software. Across those domains the constant has been integration complexity: defining API contracts, error-handling strategies, versioning policies, and the full matrix of success, failure, timeout, and async states before engineering begins. At Rohde & Schwarz I owned a multinational AI and data platform, instrumenting competing developer workflows to redirect strategy based on real pipeline telemetry rather than stakeholder opinion, a 200% increase in pipeline runs followed. At EMIL Group I shipped the Claims Center from concept to production in the insurance B2B SaaS space, within a delivery organisation I had restructured to stop senior-engineer attrition. Both roles required exactly the technically grounded requirements discipline this posting describes.

On the tooling side, I use Claude Code, Cursor, GitHub Copilot, and Lovable as part of my daily workflow, not as occasional assists but as the primary environment for writing specifications, generating acceptance criteria for edge cases, and scaffolding prototypes directly against real APIs. I built construct8, a two-sided B2B staffing marketplace, as a solo founder: the product surface runs on WhatsApp and Telegram with LLM agents across the funnel, and I own everything from API wiring to SQL-based conversion analysis. That kind of end-to-end ownership, business problem through to deployed integration, is the mode this role calls for.

I do not have direct FIX protocol production history, though I am familiar with the protocol's message types, session management, and sequencing requirements from capital-markets adjacent reading and integration design work. The pattern of defining strict sequencing, acknowledgement, and reject-handling flows is identical to the async API contract work I have shipped; I would expect the protocol-specific ramp to be a matter of weeks, not months.

Abu Dhabi is a positive factor for me. I am actively targeting UAE roles and am prepared to relocate and work fully on-site. I hold EU citizenship and require no sponsorship in the EU/EEA; for the UAE a standard employment visa is all that would be needed.

I would welcome the opportunity to walk through a specific integration challenge from the platform's current backlog in a technical conversation.

Best regards, *Philipp Hilbert*
