---

Dear RevenueCat hiring team,

I have spent thirteen years building products that help non-technical people make confident decisions from complex data, in defence AI, public-sector labour-market analytics, insurance, and healthcare. What draws me to this role is not that it is in a fast-growing company, but that it is a genuinely hard analytics product problem: you are sitting on the richest monetisation dataset in mobile, and the challenge is turning that into something a solo developer can act on before their morning coffee goes cold.

The analytics work I am proudest of happened at the Bundesagentur für Arbeit, where I owned a national labour-market data platform used by policymakers and researchers. I introduced Dagster and dbt, cut data update time by 75%, and migrated the system from bare metal to containers, not because it was on a roadmap someone handed me, but because I dug into the data pipeline myself, found where the hours were going, and fixed it. That is the disposition RevenueCat is asking for: someone who does not fully delegate the investigation to engineering when a number looks off. At Rohde & Schwarz I instrumented two competing developer workflows to decide which one to prioritise, the beautiful UI-led path recorded exactly zero clicks; the developer-code-first path drove a 200% increase in pipeline runs. Metrics-driven decisions where you have to be willing to kill your own preference are the ones I find most satisfying.

I am comfortable with SQL and have used it to build funnel and conversion analysis for construct8, my own two-sided marketplace. I prototype in code using Claude Code and Lovable, and I can hold a technical conversation about data models, API contracts, and the tradeoffs in an analytics pipeline without needing engineering to translate. On the mobile and subscription app ecosystem specifically: I do not have a shipped consumer subscription app to my name, and I want to name that directly. What I do have is deep familiarity with how developers reason about monetisation metrics from working with developer-facing data products, a strong grasp of cohort and LTV mechanics from running financial planning across several ventures, and the ability to get up to speed on a new domain fast by going straight to the data.

The benchmarking and predictive LTV work is the piece that excites me most. RevenueCat's market position makes it possible to tell a developer not just what their numbers are, but whether those numbers are good, and to do that responsibly requires getting the data model and the statistical framing right before the UI conversation even starts. That is exactly the kind of upstream analytical rigour I want to own.

I would be glad to discuss the role in more detail at your convenience.

Best regards, *Philipp Hilbert*
