Dear BestReviews hiring team,

I am applying for the Senior Product Manager, Data role. The combination of a small, close team, a distributed engineering setup across multiple continents, and a mandate to build out data analytics, automations, and partner integrations is one I have navigated before, and one I find more interesting than a large organisation with a well-funded roadmap already in place.

At the Federal Employment Agency I owned the product layer of a national labour-market analytics platform used by policymakers and researchers across Germany. The practical work looked a lot like what this role describes: I introduced Dagster and dbt so that quarterly data imports and new indicators ran without manual hand-holding, saving close to 75 percent of the time per update cycle. I also integrated test automation into the Jenkins pipeline, freeing QA capacity that was then redirected to new feature work. Those were not engineering decisions, they were product decisions about where automation would compound the team's capacity most quickly, and they required me to dig into the data flows, understand the downstream consumers, and make the case to stakeholders who were not technical.

At Rohde & Schwarz I managed the internal AI and data platform for the FCAS European defence programme, leading a cross-functional team of fifteen engineers and data scientists. I instrumented two competing design approaches, a UI-led one and a developer-code-first one, and the beautiful UI recorded exactly zero clicks. Redirecting strategy based on that signal increased pipeline runs by 200 percent. That is the kind of quantitative hypothesis-testing the BestReviews role calls for, and it is how I approach product decisions generally: agree what success looks like before building, then check afterwards whether it happened.

On the AI tooling side: I use Claude Code, GitHub Copilot, and Cursor for in-repo automation and rapid prototyping; I have built LLM-agent workflows in n8n; and I have shipped AI-powered features in a production environment. I also have five years of Python experience and am comfortable reading and writing data transformation logic, which I expect to matter when working closely with two BI developers. The Looker experience listed as a nice-to-have is the one gap in the stack, I have worked with MicroStrategy and Matomo for analytics and Dagster and dbt for pipeline orchestration, and I pick up BI tooling quickly.

I would enjoy the chance to speak about how my background fits the role. Thank you for your time.

Best regards, *Philipp Hilbert*
