Dear Fanatics Momentum team,

Fanatics Momentum is building something that does not yet have a playbook: a fully regulated multi-vertical gaming operator in the UAE, where the identity and wallet layer has to work correctly from day one. That problem, getting onboarding, KYC, and payment infrastructure right under GCGRA licensing, at the speed the market demands, is one I have spent most of my product career preparing for, even if I did not know the company name at the time.

At Kvitt Payment Solutions I owned the full consumer payments journey from zero, including the P2P wallet UX and PSP integrations, and took the product to acquisition inside the Sparkasse girocard ecosystem. At EMIL Group I ran a B2B SaaS platform for insurers and underwriters, a heavily regulated environment where compliance constraints and conversion pressure arrive simultaneously and neither can be ignored. At the Bundesagentur für Arbeit I served as Deputy IT Security Officer while owning a national analytics platform, which means I have sat on both sides of the compliance-versus-delivery tension. In all three cases the core skill was the same: turning a complex regulated journey into something a real user can complete without noticing how hard it was.

What the Fanatics Momentum posting describes as the challenge, simplifying registration and verification, improving payment reliability, building reusable shared capabilities across verticals, matches the sequence I have run at multiple employers. At CLINET Platforms I cut a mobile patient intake journey from thirty minutes to five by mapping the CGM hospital interface properly before building it. At Rohde & Schwarz I redirected an entire platform strategy after instrumenting two competing workflows and discovering the UI-led path had zero real usage. The instinct is always the same: instrument first, build second, measure the outcome you agreed before you started.

I am also a long-term active user of online poker and gaming platforms, which gives me a user-research perspective on what good and bad onboarding actually feels like from the player's side, the moment a verification step feels disproportionate, the moment a wallet withdrawal becomes a reason to leave. That domain familiarity accelerates discovery work that would otherwise require months of user interviews to build.

The UAE posting is not a stretch destination for me. It is on my active shortlist: I am willing to relocate to Dubai or Abu Dhabi and work on-site, which means I can be physically present for the cross-functional work that platform-level decisions require.

I would welcome the opportunity to discuss how my background fits the Identity, Wallet, and KYC mandate.

Best regards, *Philipp Hilbert*
