

Philipp Hilbert. *Outcome-first Product Owner for AI-augmented delivery teams.*

Positioning, 10-year PM with backlog-to-production ownership, AI-native tooling, and a payments founder background ready to drive Corpay's Corporate Payments delivery.

Dear Hiring Team,

I am applying for the Product Owner role in Corpay's Corporate Payments division. Commercial payments infrastructure is a domain I know from the inside: I co-founded Kvitt Payment Solutions, a mobile payments platform built from zero with full PSP integration, settlement flows, and consumer onboarding, which was subsequently acquired and operated by Sparkasse. That experience taught me the difference between payments as a product decision and payments as an engineering exercise, and why confusing the two is expensive.

What drew me specifically to this posting is the sentence about "actively building with AI-assisted code generation." That is not aspirational language for me, it is how I have worked for the past two years. I run a multi-agent framework in which coordinator, implementer and evaluator agents work a shared queue under guardrails I designed. With AI development tooling and a human in the loop I now deliver the output a four-person team produced full-time a year ago: requirements, interface design, frontend and backend, automated regression, architecture and operations. My usefulness in a PO role is not that I can write the code, it is that I understand the full value chain well enough to structure backlog items so that AI-assisted generation actually works rather than producing technically correct but intent-misaligned output.

My record on backlog ownership and team alignment is concrete. At EMIL Group I inherited a 17-person delivery organisation that had stalled and was losing its senior engineers. I restructured it into teams that could own something end to end, restored velocity, rebuilt client trust, and stopped what had been an almost complete talent exodus. At Rohde & Schwarz I owned full product delivery for a module of the FCAS AI backbone, from discovery through backlog, release definition, and rollout, in a multinational team spanning architects, data scientists, engineers and QA, and reduced deployment times from several days to under 40 minutes by resolving an infrastructure blocker engineering had not cracked in over a year. At

Scheidt & Bachmann I operated as PO in a fully SAFe organisation, running PI planning, release train coordination and cross-team dependency management for payment and forecourt systems in a complex matrix structure. That breadth, startup founder, enterprise delivery, defence programme, regulated data platform, is not accidental. It reflects an approach to product work where the skill being developed is pattern recognition across delivery environments, not just depth in one.

The qualities your description calls out, facilitation of mob sessions, comfort with ambiguity, backlog discipline, AI tooling in a professional context, are not areas I am building toward. They are the way I work now, and I can demonstrate each with named projects and measurable outcomes.

I would welcome the opportunity to talk through how my background maps to the specific delivery problems your Corporate Payments team is working on.

Best regards, *Philipp Hilbert*
