

Philipp Hilbert. *Payments infrastructure product owner with a decade of delivery and eight years of hands-on crypto.*

Positioning, ten years shipping regulated fintech products and eight years inside crypto markets, from CEX/DEX trading to on-ramp mechanics, ready to own Utorg's full execution cascade.

Utorg's job description names a concrete execution gap: a product owner who can hold the full context from strategic intent to shipped feature, keep cross-functional teams aligned, and make commitments land. That is not a generic PM role; it is a specific discipline that only works when the person holding it genuinely understands the product domain, not just the delivery mechanics. I want to explain why I am a precise fit for both.

On the product domain: I have eight years of hands-on experience in crypto markets, which I can speak to in operational terms. I actively trade spot and perpetual futures across Hyperliquid, Bitget, Jupiter, and Bitfinex. I use DEX aggregation via 1inch, bridge assets across chains via Across Protocol, and manage custody across self-custodial and institutional wallets. I study execution quality, slippage, price impact, liquidation dynamics, routing, using Coinglass and Hyblock Capital analytics. I have also built a backtesting and trading-bot framework from scratch, designed around the same AI-native multi-agent architecture I use in my professional product work. That background means I can read a user flow for an on/off-ramp or a crypto card and immediately see the edge cases, the regulatory pinch points, and the UX decisions that will hurt retention, without needing to be educated on the domain first.

On regulated-product delivery: at Rohde & Schwarz I owned an AI data platform module inside a European defence programme, where safety-critical data provenance, full audit trails, and multinational compliance constraints were not optional. At Bundesagentur für Arbeit I acted as deputy IT security officer while owning a national analytics platform under a recurring audit cycle. At Bundesdruckerei I owned identity management and secure data structures for pandemic monitoring under the highest privacy requirements. These environments taught me that compliance and shipping speed are only in tension if you treat them as separate concerns.

The solution is to build regulatory requirements into acceptance criteria before refinement, not after, which is a habit rather than a process.

On cross-functional execution: at EMIL Group I inherited a 17-person delivery organisation that had stalled and was losing its senior engineers. I restructured the teams, restored velocity, and rebuilt client trust, with one departure instead of the near-complete exodus that had been underway. The lever was not process; it was context. Teams that understand the why behind an initiative make better local decisions and push back on weak scope earlier. I bring the business problem and the evidence into refinement, and I stay in the room when engineering and design are working through it, rather than handing off a requirements document.

Utgorg is building the rails that will make self-custodial, stablecoin-native finance usable at scale across 130+ countries, under MiCA authorisation and PCI DSS Level 2 constraints. That is exactly the kind of infrastructure problem I want to own: technically complex, regulatory-constrained, and consequential for the people who depend on it. I would be glad to walk through any of the above in a conversation at your convenience.

Best regards, *Philipp Hilbert*
