

Philipp Hilbert. *Crypto-native product owner who ships.*

Positioning, ten years of fintech and B2B SaaS product ownership, now applied to wallets, on/off-ramps, and digital-asset infrastructure at the intersection of payments and compliance.

Dear hiring team,

I am applying for the Product Owner role because it matches both my professional background and my genuine domain investment. I have spent ten years owning product delivery in complex, regulated, technically demanding environments, B2B SaaS, national data platforms, defence AI infrastructure, and payments, and I have spent eight years as an active crypto user and builder. The combination of those two things is precisely what this role asks for.

On the product execution side: my track record is in exactly the situations this role describes. At EMIL Group I built a claims module from zero with no specification and no internal precedent, running discovery directly with a pilot customer's specialists, and simultaneously restructured a 17-person delivery organisation that had stalled. Velocity returned, client trust returned, and an almost complete senior exodus stopped at a single departure. At Rohde & Schwarz I owned full delivery of an AI data platform module for a European defence programme, requirements, backlog, release definition, rollout, and cut deployment times from several days to under forty minutes by resolving an infrastructure blocker engineering had not cracked in over a year. At Scheidt & Bachmann I was Product Owner for a payment and point-of-sale integration team in a fully SAFe organisation, managing cross-team dependencies and PI planning across geographies. Writing clear requirements, challenging scope, unblocking execution, and giving structured updates to executives are habits, not aspirations.

On the crypto side: my engagement goes well beyond user familiarity. I actively trade and manage assets across centralized and decentralized venues including Hyperliquid, Bitget, Jupiter, 1inch, and Across Protocol, using perpetual futures, spot, DEX aggregation, and cross-chain bridging. I work with liquidation heatmaps and analytics platforms such as Coinglass and Hyblock Capital, and I analyze execution concepts including slippage, price impact, routing, and market microstructure. I have built a personal backtesting engine for crypto markets and a multi-agent framework for algorithmic strategy research and live execution. I co-founded Kvitt

Payment Solutions, a mobile payments platform built from zero through PSP integration, settlement flows, and full user experience, later acquired and operated by Sparkasse. I understand wallets, on/off-ramps, and the infrastructure layer that makes crypto payments function at scale from the inside, not from a product brief.

What I bring to the cross-functional demands of this role: I keep engineering and legal and design in the same room from the start, because requirements written without those perspectives collapse at the edge cases. I define what would count as success before we build, and I instrument the product so the answer can be observed rather than debated. I have operated as the central point of reference for scope, priorities, and key decisions in every role I have held, and I am comfortable holding unemotional conversations with stakeholders whose priorities I need to challenge or re-sequence.

I would welcome the opportunity to speak in more detail about how my background maps to your specific product challenges.

Best regards, *Philipp Hilbert*
