

Philipp Hilbert. *Platform PM who has shipped fraud-adjacent infrastructure in regulated environments.*

Positioning, ten years owning complex backend platforms in regulated industries, data provenance, identity, payment flows, now applied to fraud detection and case management at scale.

§ WHY KRAKEN

Kraken is one of the few crypto platforms where the compliance and fraud infrastructure has to operate across dozens of jurisdictions simultaneously, not as an afterthought bolted onto a product but as a first-class engineering concern. The job description is explicit about that: you are not building a fraud dashboard, you are revamping case management for fraud and ATO while keeping friction near zero for legitimate clients. That tension between protection and usability is exactly the kind of product problem I find most worth solving. The phrase "minimising friction for legitimate client activity" in the posting is not boilerplate, it is a genuine product constraint with real design consequences. *That is exactly the kind of problem where breadth across discovery, operations, and infrastructure compresses a three-year build into one.*

§ HONEST FRAMING

My fraud and ATO background is adjacent rather than direct: I have owned security-grade data lineage, identity-layer infrastructure at Bundesdruckerei, and payment flows at Kvitt, but I have not carried a fraud-specific product title. The transferable mechanic is strong: I know how to model complex operational workflows, define precise API specifications, and keep cross-

functional stakeholders, Legal, Engineering, Ops, aligned around a shared requirements artefact without letting any one function own the others.

§ AI-NATIVE STACK

Daily tools, not buzzwords.

- **Claude Code**, in-repo spec generation and edge-case enumeration
 - **GPT**, requirements drafting and stakeholder-facing summaries
 - **Cursor / VSCode**, live navigation of unfamiliar codebases
 - **Lovable**, rapid interface prototyping for discovery validation
 - **Gamma.app**, roadmap and alignment presentations
 - **n8n**, multi-agent workflow design and automation orchestration
 - **GitHub Copilot**, inline code review and test-scaffold generation
 - **Framer**, clickable UX mockups for discovery sign-off
-

§ TECHNICAL ENVIRONMENT

Shipped with, not just listed.

Python, PostgreSQL, Kotlin, Kafka, Kubernetes, OpenShift, ArgoCD (GitOps), Dagster, dbt, Docker, Helm, Terraform, Argo Workflows, Jenkins, REST APIs, MongoDB, JavaScript, across production data platforms, safety-critical defence infrastructure, and payment-layer integrations.

§ SIDE PROJECT

CRYPTO BACKTEST ENGINE [GITHUB.COM/HILBERTP](https://github.com/hilbertp) →

A personal algorithmic trading and backtesting framework built to understand crypto market microstructure from first principles.

- Executes historical strategy simulations across CEX and DEX venues, ingesting order-book and liquidation-heatmap data from Coinglass and Hyblock Capital.
- Built on a Python core with a file-queue-based multi-agent coordinator loop for parallel strategy evaluation, using the same agentic architecture patterns I apply professionally.
- Active trading and monitoring across Hyperliquid, Bitget, Jupiter, 1inch, and Across Protocol, covering perpetual futures, spot, DEX aggregation, and cross-chain bridging.

- Directly relevant to Kraken's fraud domain: real-money experience on the execution layer gives firsthand intuition for the anomaly patterns, unusual routing, atypical withdrawal cadences, device-switching during high-volatility events, that fraud and ATO signals need to detect.

§ HOW I WOULD WORK AT KRAKEN

First weeks, concrete.

WEEK 1

Listen, map, find the gaps.

Shadow the Fraud Strategy and Ops teams through a live case cycle, intake, investigation, resolution, documenting every handoff, tool switch, and manual workaround before touching a single backlog item or roadmap slide.

WEEK 2

Audit then prioritise.

Map the current case management state against the gap, surface the three highest-friction points for investigators, and align with Engineering and Legal on which can be unblocked within the first release window.

WEEK 3+

Ship, measure, close.

Own the first release of the revamped case management flow end to end: acceptance criteria, API specifications, vendor integration scope, and the operational metric, cases-closed-per-investigator-per-day, that will tell us whether it worked.

I COVER LETTER

Kraken's fraud infrastructure problem is not a tooling problem, it is a systems problem. Ten million users across dozens of jurisdictions means that an ATO event in one region creates case management load that ripples across Legal, Ops, and Engineering simultaneously, and a case management system that was designed for one scale will buckle visibly at another. The job description names this precisely: you need someone who can revamp case management, define API specs, coordinate with external vendors, and keep the whole thing compliant across jurisdictions, all without adding friction for the users who have done nothing wrong. That is a product problem I understand.

My background is in exactly this class of platform: complex, compliance-critical, cross-functional, and consequential if wrong. At Rohde & Schwarz I owned a module of the AI backbone for a European defence programme, safety-critical data pipelines with full provenance and audit trails, multinational stakeholder coordination, and a hard requirement that nothing shipped without traceability. At Bundesdruckerei I owned secure identity infrastructure for national pandemic monitoring under the highest privacy requirements in German law. At Bundesagentur für Arbeit I served as deputy IT security officer while running the data platform, which meant owning compliance, governance, and data lineage under a recurring audit cycle. None of those were fraud roles. All of them trained the same muscle: translating a complex operational reality into precise, implementable requirements that Engineering, Legal, and Ops can all sign off on.

On the fraud and ATO domain itself, I am not starting from zero. I have spent eight years as an active participant in crypto markets, trading across Hyperliquid, Bitget, Jupiter, and Across Protocol, studying liquidation heatmaps and market microstructure, and building a backtesting framework from scratch. That depth means I already have a working mental model of the anomaly patterns that fraud and ATO signals need to catch: device-switching during high-volatility windows, unusual withdrawal routing, account behaviour that is statistically normal until it is not. What I bring on day one is genuine domain intuition, not a reading list.

The case management revamp named in the posting is the kind of zero-to-one problem I have done before. At EMIL Group I built a claims module with no specification and no internal precedent, running discovery directly with a pilot customer's claim specialists until I had enough signal to define the product. I then instrumented the flow so that churn per process step became the prioritisation metric, not velocity, not story points, but the operational number the business actually cared about. That is the same approach I would take here: map the current investigator workflow first, find the highest-friction handoffs, and build the measurement into the product before the first release rather than after.

Kraken's scale and its commitment to operating as a genuinely global platform make this role interesting beyond the immediate problem. An open financial system has to be a trustworthy one, and the fraud and ATO infrastructure is where that trust is tested at the individual user level every day. I want to own that.

Best regards, *Philipp Hilbert*

II CURRICULUM VITAE

§ BEARING

Ten years of product ownership across regulated, compliance-critical platforms, defence AI infrastructure, national identity and health data systems, B2B insurance, and payments, with a personal track record in crypto markets that runs deeper than most PM CVs in this space. I own complex cross-functional programs from discovery to production, hold Engineering and Legal to a shared requirements artefact, and build measurement into the product before the first release. My working mode is AI-native: I use agentic tooling to compress discovery, prototyping, and specification work that previously required a larger team. I am applying this to fraud and ATO infrastructure because the problem is technically interesting, consequential, and squarely inside the platform-product competency I have been building for a decade.

§ CORE STRENGTHS

- Cross-functional alignment: Engineering, Legal, Compliance, Ops, vendors
 - Operational workflow mapping into precise, implementable API specifications
 - Security-grade data lineage, audit trails, and provenance for regulated environments
 - Zero-to-one feature delivery with no prior specification or internal precedent
 - Instrumentation-first: defining success metrics before the build starts
 - Discovery in hostile territory: defence, national health data, financial compliance
 - AI-native execution: multi-agent frameworks, agentic spec generation, rapid prototyping
 - Payment flow and PSP integration product design, including edge-case and settlement logic
 - Vendor integration scoping and technical requirements for third-party providers
-

§ PROFESSIONAL EXPERIENCE

CONSTRUCT8 2025, PRESENT

Product Manager, B2B Marketplace

- Zero-to-one product: vision, strategy, discovery, and operational workflow design for a two-sided marketplace with three distinct user groups
- Designed full AI-assisted vetting and onboarding flow to keep internal operational cost to a single operator
- Owns user journey optimisation across contractors, workers, and internal operations staff

ROHDE & SCHWARZ 2024, 2025

Product Manager, AI and Data Platform (FCAS defence programme)

- Full ownership from discovery to production for a safety-critical AI data backbone: requirements, backlog, release definition, rollout
- Designed reproducible pipelines with complete provenance and audit trails, directly analogous to the case management and attribution accuracy requirements in fraud infrastructure
- Reduced deployment times from several days to 20, 40 minutes; resolved an infrastructure blocker Engineering had not cracked in over a year
- Steered a multinational team of architects, data scientists, engineers, and QA across a regulated, audit-heavy environment

Kubernetes, OpenShift, GitOps (ArgoCD), Kotlin, Python, PostgreSQL, Kafka

BUNDESAGENTUR FÜR ARBEIT 2023, 2024

Product Manager, Data and Analytics Platform

- Introduced automated ETL orchestration and standardised CI/CD for a national analytics platform used by policymakers and researchers
- Deputy IT security officer: compliance, governance, and data lineage under a recurring audit cycle, equivalent responsibility to what fraud infrastructure compliance requires
- Defined data lineage and audit standards for a warehouse-grade stack under ongoing regulatory scrutiny

Python, PostgreSQL, Dagster, dbt, Kubernetes

EMIL GROUP 2022, 2022

Product Manager, B2B SaaS Platform

- Built a claims module from zero with no specification, running discovery directly with a pilot customer's claim specialists, structurally identical to designing fraud case management from first principles
- Instrumented the claim flow so that churn per process step became the leading prioritisation metric, creating a measurable feedback loop between operational behaviour and product decisions
- Restructured a 17-person delivery organisation into effective teams; restored velocity and client trust after an extended stall
- Delivered modules across underwriting, policy issuance, and document workflow automation

CLINET PLATFORMS 2021, 2022

Product Owner, Mobile Application (iOS and Android)

- Shipped a hospital application across two platforms for multiple distinct user groups with separate access and identity requirements
- Implemented the interface into the incumbent clinical system landscape directly, giving firsthand fluency in legacy system integration patterns
- Cut an overambitious roadmap to the ten percent of features with real user value

BUNDESDRUCKEREI 2021, 2021

Product Owner, National Health Data Platform

- Owned secure data structures and identity management for national pandemic monitoring under the highest privacy requirements in German law
- Directly relevant to ATO and identity management: the product was fundamentally an identity-layer problem at national scale

SCHEIDT & BACHMANN 2020, 2021

Product Owner, Integration Team (Fuel and Convenience Retail)

- Product Owner of the integration team downstream of research, turning outcomes into releasable integrations across point-of-sale, payment, and forecourt systems
- Backlog ownership in a fully SAFe organisation: PI planning, release train coordination, cross-team dependency management across a complex matrix spanning geographies and disciplines

AOK ITSCARE 2019, 2020

Proxy Product Owner

- Migrated an internal procurement platform serving approximately 20,000 employees across three regional health insurers, with catalogue and API integration into legacy approval workflows

§ FOUNDER & EARLY-STAGE EXPERIENCE

KVITT PAYMENT SOLUTIONS 2013, 2018

Founder and CFO

- Built a mobile payments platform from zero: PSP integration, settlement flows, onboarding, and full user experience; subsequently acquired and operated by Sparkasse
- As CFO owned accounting, financial planning, and investor reporting

- Payment flow design at this level, including edge cases, settlement timing, and fraud surface, is directly applicable to Kraken's fraud and ATO context

QCRYPT AG 2016, 2018

Co-Founder and Product Owner

- Co-founded and owned the product architecture for a quantum-secure encryption system shipped to enterprise customers under a sub-two-minute installation constraint
- Deputy IT security role gave hands-on ownership of attack vector mitigation and security product requirements
- Owned backup, restore/checkpoint, and data-encryption architecture across a three-layer hardware and software stack

SMART SOIL TECHNOLOGIES 2016, 2021

Co-Founder, CDO and CFO

- Brought a nanotechnology product from laboratory to investor rounds; owned finance, HR, and the ERP rollout
