Dear Hiring Team,

The brief you have written describes something I have been building toward across my last four roles: owning AI-enabled digital products for enterprise and government clients, from the first ambiguous conversation through to a measured outcome. That is not a trajectory I adopted recently because the market moved in that direction. It is the thread that runs from the Bundesagentur für Arbeit analytics platform through Rohde & Schwarz's AI data backbone for a European defence programme, and into the multi-agent development framework I run today.

At Rohde & Schwarz I owned a module of the central AI pipeline for the FCAS programme, multimodal data ingestion, provenance and audit trails, and reproducible ML training datasets. I reduced deployment times from several days to under forty minutes by resolving an infrastructure blocker engineering had not closed in over a year, and I did it by understanding the Kubernetes and GitOps stack well enough to find the constraint rather than defer to specialists. That technical depth is what separates a product manager who can evaluate AI feasibility from one who must accept whatever the engineering team reports. Your posting asks for exactly that judgment, and I have exercised it in production environments where the cost of getting it wrong was not a missed sprint but a failed audit.

Client-facing work is the other dimension your posting weights heavily. I have led workshops with government procurement officers, presented roadmaps to executive steering committees inside a German federal agency, and rebuilt client trust at EMIL Group after inheriting a delivery organisation that had stalled. Rebuilding trust with enterprise clients is not a communication skill, it is a product skill. It requires showing people a concrete next step, a small bet that resolves something real, before you ask them to commit to a larger plan. I treat every stakeholder conversation as discovery: what does the client actually believe the product should do, and how does that differ from what we are building?

The AI-native working mode your organisation describes is not an aspiration I am growing into. I currently run a coordinator-implementer-evaluator agent framework with a shared task queue, where I produce requirements, interface prototypes, backend logic, automated tests, and deployment configuration in the time a small team needed a year ago. I use Claude Code, Lovable, n8n, and Framer daily. That compression of the product delivery cycle is what allows a senior product manager to operate at the pace your clients expect from an innovation-focused organisation. It is also what allows me to evaluate AI capabilities and limitations honestly, I have watched these systems fail in production and I know where the guardrails need to go.

I would welcome the opportunity to discuss how this experience maps to the specific products and clients your organisation is building for. I am willing to relocate to Abu Dhabi and available at short notice.

Best regards, *Philipp Hilbert*
