

Philipp Hilbert. *Platform PM for multi-tenant AI infrastructure.*

Positioning, I've shipped B2B2B platforms with partner-facing APIs, multi-tenant billing, and tenant isolation, the exact surface OpenRouter Connect is building.

Dear OpenRouter team,

I've spent 13 years as a Product Manager and Product Owner shipping platform products that other companies' engineers build on. The problems Connect is solving, tenant isolation, delegated administration, per-end-user policy, usage metering across a partner's customer base, are not new to me. At EMIL Group I owned a B2B SaaS platform for insurers, reinsurers, and brokers where each client needed its own policy controls and billing view. At Qcrypt I built an enterprise security product with per-customer installation and licensing constraints. Both required the same thinking Connect does: you're not just building features, you're building abstractions that hold up when a dozen partners each have different requirements for their own customers.

The zero-to-one dimension of this role is also familiar. At EMIL Group I shipped the Claims Center from concept to production in an 18-person organisation that had lost its senior engineers and its clients' trust. At construct8, my current venture, I built a two-sided B2B marketplace alone: partner onboarding, anonymity-until-payment mechanics, LLM agents across the funnel, and SQL-based conversion tracking. Getting a product from design partners to general availability while keeping the abstractions clean rather than piling up one-off integrations is the part of the job I find most interesting.

On the technical side: I read API specs, call SDKs myself, and have strong opinions about auth models and tenant isolation. I've shipped GitOps rollout pipelines with ArgoCD, owned ETL and data platform products with Dagster and dbt, and built agentic workflow loops with n8n and LLM tooling. I use OpenRouter in my own work, so I come with a real user's sense of where the friction sits in the current developer experience.

The commercial model question, building a win-win-win for partners, their end customers, and OpenRouter, is exactly the kind of problem I want to be close to. At Kvitt Payment Solutions, the mobile P2P payments startup I co-founded and took to acquisition by Sparkasse, I worked through revenue share and billing mechanics on both sides of a partnership. I know what finance teams on each side need from metering and invoicing, and I know what it takes to make usage-based pricing feel fair rather than opaque.

I'm based in Berlin, work fully remote, and am available on four weeks' notice. I'd be glad to talk through any of this in more detail.

Best regards, *Philipp Hilbert*
