

Philipp Hilbert. *Senior Product Manager scaling SMB formation platforms.*

Positioning, I build 0-to-1 products for small business users and automate the operational workflows behind them, which is exactly what this role calls for.

Dear Forbes Advisor team,

I have spent 13 years shipping products in regulated, operationally complex environments, insurance, public-sector data platforms, healthcare, and fintech. At EMIL Group I took the Claims Center from concept to production and cut the time to launch a new insurance product from months to under a week. At Bundesagentur für Arbeit I automated quarterly data imports with Dagster and dbt, cutting the time per data update by roughly 75%. These were not isolated wins. They came from the same pattern this role asks for: map the operational workflow, find where friction concentrates, and build the thing that removes it.

The formation and management platform you are building sits in a space I find interesting. Small business owners forming their first company are making one of the highest-stakes decisions of their professional lives, but they are doing it with limited time, limited legal fluency, and low tolerance for complexity. Building a product that makes that process feel straightforward, while automating the backend workflows that make it economical to serve them, is a hard problem worth solving.

The 0-to-1 brief resonates in particular. At construct8, my own two-sided marketplace, I went from blank page to a live product alone: anonymity-until-payment model, LLM agents across the funnel, WhatsApp and Telegram as the product surface, and SQL for funnel analysis. At Kvitt Payment Solutions I took a P2P payments product from zero to acquisition by Sparkasse, operating inside the girocard ecosystem. I know what it takes to move from hypothesis to customer validation to scaled launch, and I know the places where founders typically slow down or build the wrong thing.

On the data side I am comfortable in SQL and have owned analytics instrumentation across multiple platforms, from funnel and churn analysis to KPI definition and post-launch iteration loops. I have used Figma for prototyping across stakeholders and Amplitude-equivalent tools for product analytics. I am also an active builder with AI-native tooling: I use Claude Code, Cursor, n8n, and Lovable daily, and I have designed and shipped agentic workflows that run with minimal human intervention.

I would welcome the chance to talk through the formation platform's current priorities and where I could make the biggest difference in the first quarter.

Best regards, *Philipp Hilbert*
