Dear Ansen Hiring Team,

Ansen's product brief reads like a job description written for the gap I have been filling across the last five years: technically fluent Product Management at the seam between AI-enabled workflows and environments where security, auditability, and constrained deployment are non-negotiable requirements rather than late-stage concerns. I would like to make the case that I am the right person to own this roadmap.

At Rohde & Schwarz I led Product Management for the internal AI and data platform supporting the FCAS European defence programme, a multinational, security-sensitive environment with strict data handling requirements, no tolerance for outages, and a cross-functional team of more than fifteen engineers and data scientists. I instrumented two competing product directions, killed the one with zero adoption, and redirected strategy toward developer-code-first workflows that increased pipeline runs by 200%. The lesson I took from that project: in technically complex, regulated environments, the product manager's primary value is translating ambiguous operational reality into clear, testable requirements, and having the discipline to measure before declaring success. That is the core of what Ansen's FDE pod description is asking for.

At Bundesagentur für Arbeit I held the role of Deputy IT Security Officer alongside product responsibilities, which gave me direct exposure to audit logging, data classification, access control, and the operational reality of running analytics products inside a highly regulated public-sector environment. I introduced Dagster and dbt to eliminate manual ETL hand-holding, cutting data update time by roughly 75%, and I carried a full containerisation migration and UI relaunch through the same period without disrupting quarterly reporting cycles. The combination of data platform ownership and security awareness in a regulated environment maps directly onto the eGRC and sensitive-environment dimensions Ansen describes.

On the applied AI side, I design and prototype with Python, SQL, notebooks, and Figma daily. I have shipped LLM agent workflows in my own startup (construct8) where agents handle intake, matching, and follow-up across a two-sided marketplace, and I treat evaluation loops, feedback mechanisms, and human-in-the-loop controls as first-class product requirements rather than engineering details. I am also the co-founder of Qcrypt AG, a quantum-resistant encryption company, where I owned the entire product architecture for a hardware-plus-software security product sold into enterprise buyers, including the installation constraint that drove us to a three-layer design that deploys in under two minutes. Security as a product property rather than a compliance checkbox is a perspective I carry into every role.

The gap I want to name honestly is dedicated eGRC product experience, I have not owned a standalone risk-and-control or regulatory reporting product. What I do bring is deep familiarity with the operational workflows that eGRC products serve: compliance evidence gathering, audit readiness, policy enforcement, and regulated data environments, experienced from the product and security-officer side at Bundesagentur für Arbeit and Bundesdruckerei. I learn adjacent domains quickly by spending time with users before touching the roadmap, and the transferable mechanics, structured requirements engineering, evaluation criteria, release planning, and adoption metrics, are fully in place.

I would welcome the opportunity to discuss how my background fits the FDE pod's current priorities. I am based in Berlin, available at four weeks' notice, and open to travel or relocation where the role requires it.

Best regards, *Philipp Hilbert*
