Dear Bjak team,

I am applying for the Product Owner, Technical, AI Neobank role. The posting describes something specific: an owner who starts from user problems, works closely with engineering, ships fast, and keeps improving after launch. That is a description of how I have worked for thirteen years, not an aspiration.

My fintech background is direct. I co-founded Kvitt Payment Solutions, a mobile P2P payments product that went from zero to acquisition by Sparkasse and integration into the girocard ecosystem. I understand the full arc, user problem definition, regulatory constraint, payment flow design, launch, and handover to an operator at scale. At EMIL Group I owned the insurance B2B SaaS platform for insurers, reinsurers and brokers: I shipped the Claims Center from concept to production, cut time-to-market for new insurance products from months to under a week, and restructured a failing 18-person delivery organisation into three stable teams after the original was losing senior engineers faster than it could replace them. Both experiences required exactly the trade-offs the posting names: speed versus compliance, user experience versus operational complexity, business impact versus honest attribution.

The AI dimension of this role is not new territory for me either. At Rohde & Schwarz I owned the internal AI and data platform for the FCAS European programme. I instrumented competing workflows to find that the beautifully designed UI-led path recorded exactly zero clicks, and redirected the platform strategy accordingly, pipeline runs increased 200% by following the data rather than the original design conviction. I now build with AI tools daily: Claude Code for spec generation and edge-case coverage, Lovable and Framer for rapid prototyping, and agentic workflows in n8n for automation I used to delegate to a small team.

Southeast Asia's financial services market is one I have been watching for a different reason: I trade actively across centralised and decentralised venues and have spent years studying payment rails, stablecoin infrastructure and cross-border exchange mechanics. Bjak's expansion from insurance into payments, savings and travel finance maps directly onto the infrastructure problems I find most interesting. The mission, helping people get more from their money, is not generic to me; I understand the specific friction points in each product area the posting names.

I work best in environments where ownership is real, data is incomplete, and shipping something testable beats writing a perfect specification. I am based in Berlin, immediately eligible to work, and available within four weeks of an offer.

Best regards, *Philipp Hilbert*
