Dear Bjak Hiring Team,

I am writing to apply for the Product Owner, Technical, AI Finance role. I have spent thirteen years shipping financial products in regulated environments, P2P payments taken to acquisition by Sparkasse, an insurance B2B SaaS platform at EMIL Group, a public-sector analytics platform, and defence AI infrastructure, and the Bjak posting describes the way I already work: start from user problems, cut complexity, ship fast, and keep caring after launch.

At Kvitt Payment Solutions I built a mobile group P2P payments product from zero and took it to acquisition, ending up operating inside the girocard ecosystem. That required navigating payment regulation, designing edge-case-heavy user flows, and making product decisions with incomplete data because there was no prior product to learn from. At EMIL Group I inherited an eighteen-person delivery organisation losing senior engineers and client trust, restructured it into three focused teams, shipped the Claims Center from concept to production, and cut the time to launch a new insurance product from months to under a week. Those two experiences, one founding-stage, one rescue, cover most of the scenarios a fast-moving fintech platform will put in front of a PM.

I understand the infrastructure that makes fintech products work at scale. I have owned Kubernetes-based platform delivery, ETL pipelines for regulated data, GitOps rollout that reduced deployment time from days to thirty minutes, and compliance-adjacent work as Deputy IT Security Officer. That means I can work deeply with engineering, read the stack, and make trade-offs between speed, user experience, and operational risk without hiding behind a requirements document.

On the AI side, I use Claude Code, GitHub Copilot, Cursor, Lovable and n8n daily, not as productivity theatre but as actual delivery tools. I built a two-sided marketplace alone, running LLM agents across the funnel. I am genuinely interested in the AI Finance space because the hardest problem is not adding an LLM to a flow: it is designing the human-in-the-loop checkpoints that keep a regulated financial product trustworthy. That design problem sits exactly at the intersection of product sense and technical depth.

Bjak is based in Southeast Asia and I am in Berlin; I have worked in fully remote, multinational teams across European defence programmes and know what it takes to build trust asynchronously. I move fast on assessments and interviews and am available at four weeks' notice.

Best regards, *Philipp Hilbert*
