

Philipp Hilbert. *Product operator who turns operational complexity into shipped software.*

Positioning, ten years of end-to-end product delivery across regulated, complex, and fast-moving B2B environments – built for a proptech team scaling across Europe.

Dear Ukio team,

Ukio's core operational challenge is one I recognise well: as a proptech company scales across cities and countries, the internal tooling that worked for a handful of apartments starts to break under the weight of real complexity – more markets, more edge cases, more stakeholders with competing priorities. The PM role you are hiring for sits right at that inflection point, and it is the kind of problem I have spent nearly ten years building the muscle to solve.

At Emil Group, I joined an InsurTech B2B SaaS platform that had lost delivery discipline under exactly this kind of pressure. The team was too large, the backlog was unmanageable, and a key client had lost confidence in the product. I split a 17-person squad into smaller, purpose-built Scrum units, reintroduced velocity tracking and structured refinement, and ran weekly product workshops that rebuilt client trust within a quarter. At Rohde & Schwarz, I owned an AI data platform end-to-end – writing user stories, supporting implementation, and managing GitOps-based rollout – while coordinating across architects, data scientists, frontend and backend engineers, and multinational government stakeholders. At the Federal Employment Agency, I served as Deputy IT Security Officer while simultaneously delivering new analytics features and migrating a legacy system to Kubernetes. In all three cases, the common thread was turning complex, multi-stakeholder environments into a steady, predictable flow of shipped product.

Your job description calls out SQL fluency and an interest in AI tooling as meaningful differentiators. Both are genuine parts of my daily practice, not resume items. I use Claude Code and Cursor to accelerate requirements work and validate implementation logic. I have designed ETL pipelines with Dagster and dbt, modelled data provenance systems, and built lightweight automations with n8n. Basic SQL is not a stretch – I use it to interrogate data directly rather than waiting for an analyst to translate a question. For a proptech platform where pricing, availability, and booking logic all live in structured data, that matters.

I am based in Berlin, which puts me a short flight from Barcelona, Madrid, Lisbon, and Paris – and I am comfortable operating fully remote in the interim. I am an EU citizen with no visa requirements. I would be glad to walk through any of the projects above in more detail, and I look forward to hearing from you.

Best regards, *Philipp Hilbert*
