Dear Riverty Hiring Team,

Product Manager Integration is, at its core, a platform standardisation role wearing a customer-onboarding label. The job description makes this explicit: the mandate is building templates, configuration solutions, shared data models, and interface standards – then ensuring the people who touch every new client actually apply them. That is a different and harder problem than running integrations one by one, and it is one I have approached systematically in several contexts.

At Emil Group, I inherited a delivery environment where every client had been handled as a special case. Sprint discipline had collapsed, a 17-person team had no shared ownership model, and client trust was deteriorating. My first move was not to deliver faster – it was to introduce structure: split the team into accountable Scrum units, reintroduce velocity tracking, and run weekly product workshops that gave clients a predictable communication rhythm. Within two months, attrition had dropped and delivery had stabilised. The mechanism was the same one Riverty needs: convert individual heroics into repeatable process.

At Rohde & Schwarz, I delivered autonomous feature sets end-to-end – user stories through GitOps rollout – on a multinational government programme with strict auditability requirements. Reducing deployment time from several days to under forty minutes was a direct result of introducing a standardised GitOps pipeline with ArgoCD rather than allowing each engineer to deploy in their own way. Standardisation here was not a process preference; it was a measurable engineering outcome.

My technical fluency is practical rather than decorative. I have worked with REST API integration in multiple contexts, including PSP integration at Kvault Payment Solutions and CGM API integration at CLINET Platforms, and I understand where integration contracts break – at data model mismatches, undocumented edge cases, and missing error handling. That

means I can write requirements that engineers can implement without rework, and I can hold a technical conversation with an architect about why a proposed interface design will not scale.

On AI-native product execution: I use Claude, GitHub Copilot, and n8n as daily working tools – for requirements drafting, edge-case generation, and workflow automation respectively. This is not background knowledge; it is the way I structure discovery and reduce the time between insight and documented requirement.

I am a native German speaker with C2 English, based in Berlin, and available with four weeks' notice. I would welcome the opportunity to speak about how this role fits the next stage of Riverty's integration infrastructure.

Best regards, *Philipp Hilbert*
