Dear Hiring Team at Kraken,

I am writing to apply for the Senior Product Manager, Consumer role. I have spent more than ten years owning product in regulated financial environments, payments at Kvitt (acquired into the girocard ecosystem), insurance infrastructure at Emil Group, and AI data platforms at Rohde & Schwarz for the FCAS programme, and I have been a hands-on crypto user and builder for eight years. Kraken's consumer product, which lets users instantly buy, sell, and convert any combination of stocks, cryptocurrencies, and cash, is the kind of full-stack trading challenge I want to own next.

The posting asks for comfort prototyping with Claude Code and Cursor before writing specs. This is already how I work. When I built construct8, a two-sided construction staffing marketplace, I used Claude Code to generate the funnel logic, Lovable to validate the UX before writing a single story, and SQL for funnel and churn analysis throughout. At Rohde & Schwarz I instrumented two competing UI workflows for an internal AI platform and let the usage data, zero clicks on the beautiful UI-led design, redirect the roadmap, increasing pipeline runs by 200%. Cheap experiments make expensive decisions safer; that principle is the same whether the product is a defence data pipeline or a retail trading interface.

My crypto and DeFi experience goes beyond a trading account. I actively trade perpetual futures and spot across Hyperliquid, Bitget, Jupiter, and 1inch, work with liquidation heatmaps on Coinglass and Hyblock Capital, and have spent significant time analyzing slippage, price impact, and routing mechanics. I build my own backtest engine and trading automation, and I understand the infrastructure layer, stablecoins, custody, exchange connectivity, cross-chain bridging, that makes digital asset markets function at scale. That combination of user-level depth and systems thinking maps directly to Consumer Trading's product suite.

On the delivery side, I have run cross-functional teams of fifteen or more through Scrum under hard constraints. At CLINET I cut a bloated roadmap to the top ten percent of features against agreed success measures and raised user acceptance fivefold. At EMIL Group I restructured an eighteen-person organisation into three lean teams and shipped the Claims Center from concept to production. I bring the same discipline to stakeholder alignment, UAT ownership, and data-driven prioritisation that the posting describes as core expectations.

Kraken's stated goal of advancing an open, global financial system is not a tagline I am repeating back: it is the reason I have stayed close to this space through multiple market cycles. I would be glad to discuss how my background maps to the specific initiatives Consumer Trading is running.

Best regards, *Philipp Hilbert*
