Dear Sumsu team,

Sumsu's posting describes a specific problem: clients log in, get lost, and do not reach full production deployment without engineering hand-holding. I have solved a version of this twice. At CLINET Platforms I cut a bloated roadmap to the top 10% of features and watched user acceptance rise more than fivefold. At EMIL Group I shipped the Claims Center from concept to production in an organisation that had lost client trust, while restructuring the delivery team so it could sustain the pace.

The work you are describing, activation flows, product tours, a self-serve communication system, A/B tests on onboarding funnels, is product craft I have applied in B2B SaaS contexts, including insurance and healthcare platforms where the client is also a professional user managing a complex workflow. I know what it takes to get a non-technical buyer from first login to "this is working in our process." The answer is almost never more features; it is a shorter path to the first meaningful outcome.

I also bring relevant context from the crypto and fintech side. I co-founded Kvitt Payment Solutions, which was acquired and operated inside the Sparkasse girocard ecosystem. I have 8 years of hands-on crypto experience across CEX and DEX venues, and I spent time at Polygon working with L2 infrastructure. Sumsu's client list includes Bybit, Bitpanda, and Wirex, so I am not learning that world from scratch.

On the AI-native side: I prototype with Claude Code, Lovable, and Framer, and I build agentic workflows with n8n. When I investigated two competing workflow designs at Rohde & Schwarz, I could instrument and interpret the data myself rather than waiting for an analyst. That speed matters on a team building self-serve tooling.

I would welcome a conversation about the activation funnel challenges you are trying to solve. I am available at short notice.

Best regards, *Philipp Hilbert*
