Dear Hiring Team,

Investment management runs on information advantage, and the gap between the firms that have it and the ones that don't is widening fast as AI tooling matures. The role you are hiring for, Senior AI Product Manager bridging business leaders, data scientists and engineers, is the exact position I have been building toward across 13 years in regulated, complex environments.

At Rohde & Schwarz I owned the internal AI and data platform for the FCAS European defence programme. I led a cross-functional team of 15+ engineers and data scientists, introduced GitOps delivery with ArgoCD that cut rollout time from days to 30 minutes, and redirected the product roadmap based on direct instrumentation of user workflows, one competing design recorded zero clicks, so we killed it. That kind of technical judgement applied to product decisions is what your posting is asking for, and it is how I work on every engagement.

At the Bundesagentur für Arbeit I owned a national labour-market analytics platform. I introduced Dagster and dbt for ETL automation, saving 75% of the time per data update, migrated the platform from bare metal to containers, and carried a full UI relaunch through the same period while acting as Deputy IT Security Officer. Data product ownership in a high-stakes environment with senior stakeholder visibility is not new territory for me.

Your posting flags fintech and investment management experience as advantageous. My background in payments includes building a P2P mobile payments product from zero to acquisition by Sparkasse inside the girocard ecosystem, and owning B2B SaaS platforms for insurance and financial services at EMIL Group. I am also a hands-on practitioner in crypto and DeFi infrastructure, perpetuals, DEX aggregation, cross-chain execution, and the data and analytics stack that sits on top of it. I understand how financial systems are built, not just how they are presented.

On the AI side: I do not just advise on AI products. I prototype with Claude Code, GitHub Copilot and Lovable, I have designed and shipped LLM agent workflows, and I understand model deployment, machine learning pipelines and the governance questions that come with both. I built my own agent framework and a backtesting engine for crypto markets. I know what a working prototype looks like and what it costs to turn one into a production system.

The role is a good fit on the technical depth, the regulated-industry background, and the senior stakeholder exposure. I am available at short notice and happy to discuss the specifics of the mandate.

Best regards, *Philipp Hilbert*
