

Philipp Hilbert. *Trading PM with crypto infrastructure depth.*

Positioning, I have shipped regulated financial products end-to-end for 13 years and spent 8 years as an active crypto trader and builder across spot, perpetuals, and DeFi.

Dear Crypto.com team,

I have been trading crypto across centralized and decentralized venues for eight years, and building products in regulated financial environments for thirteen. Perpetuals on Hyperliquid, spot routing via Jupiter, cross-chain execution on Across Protocol, these are part of my daily workflow, not research background. I also build: I have a backtesting engine running on real order-book data and a dev agent framework I put together to accelerate my own shipping. I am applying because the Trading PM role at Crypto.com is one of the few where both sides of that actually matter.

The job description names a specific tension I recognise: retail clarity against power-user depth. I have made that call in financial products before. At EMIL Group I shipped the Claims Center from zero and cut time-to-market for new insurance product launches from months to under a week. At Rohde & Schwarz I redirected a platform strategy after instrumenting two competing workflows and finding that the more polished UI-led one recorded zero clicks in production. The lesson both times was the same: what users say they want and what their behaviour shows are different inputs, and the PM's job is to treat both seriously without confusing them.

I use AI tools as a part of how I work, not as a credential. Claude Code, GitHub Copilot, Cursor, and Lovable are in my daily workflow. I built my own agentic pipelines in n8n and file-queue-based agent loops in Python. At construct8 I ran the entire funnel solo using LLM agents for discovery, conversion, and SQL-based analysis. I mention this because the role explicitly requires an AI-native workflow, and I want to be specific rather than just checking the box.

On the crypto domain: I actively trade perpetuals, manage cross-chain positions, and study execution quality using Coinglass and Hyblock Capital. I have developed detailed ideas on market microstructure, slippage, routing, and risk management from first-hand use. I understand the infrastructure layer, stablecoins, custody, exchange connectivity, because I work with it. I also know how quickly the rails move in this market, and I know that the playbook has to be rebuilt as the market shifts rather than carried over from the last role.

The 80M-user scale and the explicit ownership model described in this posting are what make it interesting to me. I look forward to talking through what I would bring to the Trading roadmap.

Best regards, *Philipp Hilbert*
