Dear Libra Solutions team,

I have spent 13 years as a product manager and product owner in regulated, operations-heavy environments, insurance B2B SaaS at EMIL Group, national labour-market analytics at the Federal Employment Agency, and defence AI at Rohde & Schwarz. In each of those roles the core challenge was the same one C3 faces: complex operational workflows, multiple domain stakeholders, and a need to ship product increments that real users trust. I know how to do that work.

Your job description calls out hands-on fluency with Claude and similar AI platforms for daily product work. I use Claude, Claude Code, GitHub Copilot, Lovable, and n8n every day, for discovery synthesis, edge-case generation, UAT planning, and agentic workflow automation. At Rohde & Schwarz I redirected product strategy based on instrumented workflow analysis, which doubled pipeline runs. At EMIL Group I shipped the Claims Center from concept to production in an insurance B2B SaaS platform with no prior precedent in the organisation. I understand what it means to define guardrails and human oversight for AI-enabled features, because I have built those structures in environments where a production failure has real downstream consequences.

The C3 role spans underwriting, negotiations, servicing, payment processing, and document management. That breadth is familiar territory. At EMIL Group I worked across underwriting and insurance product launch workflows; at the Federal Employment Agency I owned a full ETL migration and UI relaunch simultaneously while managing data-update cycles for policymakers. I am comfortable holding multiple domain threads without losing backlog health or requirements quality.

I also bring a direct parallel from my own work. I built construct8, a two-sided B2B marketplace for construction staffing, as a solo founder using LLM agents across the intake funnel and WhatsApp as the product surface. The anonymity-until-payment model required careful thinking about trust, compliance, and fallback paths, the same design considerations that matter for AI features in a regulated environment like legal funding. It is a small project, but it reflects how I actually work.

I am looking for a role where I can own a platform that matters to a real business and where the team takes product quality seriously. The description of C3, and the specificity about AI tooling and outcome tracking, suggests Libra is that kind of company.

Best regards, *Philipp Hilbert*
