

Philipp Hilbert. *Product Manager, Data Onboarding.*

Positioning, ten years owning data pipelines, ETL migrations, and onboarding tooling across regulated B2B SaaS, now applied to getting liquor retailers live faster.

Dear Scotch hiring team,

I am applying for the Product Manager role on your Data Onboarding team. I read the posting carefully, and the problem description is precise enough that I want to engage with it directly rather than pitch generically.

Getting a liquor retailer live means parsing years of legacy POS data that was never designed to be exported, cleaning it without breaking the relationships between items, vendors, and prices, and then handing a store owner a system they trust on day one. I have run a version of this problem twice at meaningful scale. At the Bundesagentur für Arbeit I owned the ETL pipeline for a national labour-market analytics platform: I introduced Dagster and dbt to replace hand-held quarterly imports, cutting data update time by roughly 75%, and I carried a full bare-metal-to-container migration in the same period without disrupting production. At Rohde & Schwarz I owned the data platform for the FCAS European defence programme, the challenge there was not just the pipeline but making the platform trustworthy enough that multinational engineering teams would actually run their workloads on it. I instrumented two competing delivery workflows and discovered that the visually polished UI-led path recorded exactly zero clicks; redirecting to developer-code-first increased pipeline runs by 200%.

The self-serve trajectory you describe, from specialist-heavy installs toward something the retailer does themselves, is a product arc I have thought about and shipped before. At CLINET Platforms I took a five-person healthcare team with an undeliverable roadmap, cut it to the top 10% of features against agreed success criteria, and then implemented the CGM interface into hospital information system workflows, reducing the digital anamnesis from 30 minutes to 5. The mechanic is the same: identify where specialist time is spent, automate or simplify that step, measure, repeat. At Emil Group I shipped the Claims Center from concept to production and cut time-to-market for a new insurance product from months to under a week, in a B2B SaaS platform context not unlike what Scotch is building.

On AI tooling: I use Claude Code and Cursor daily for spec drafting and edge-case generation, Lovable for rapid internal tooling prototypes, and n8n for agentic workflow automation. The posting specifically mentions developing Claude skills for your own workflows, I build and iterate on these regularly, and I see them as a genuine multiplier on discovery and requirements work, not a credential to name-drop.

Scotch is early enough that my work would shape the onboarding platform's architecture, not just fill a roadmap slot. The combination of payments infrastructure, retail operations, and data migration in a single product is the kind of cross-stack scope that most PM roles at this stage do not offer. I would like to bring my experience from regulated data pipelines, B2B SaaS onboarding, and self-serve automation to the problem of getting liquor retailers live faster and with more confidence.

I am happy to walk through any of the specifics above in a conversation.

Best regards, *Philipp Hilbert*
