

Philipp Hilbert. *Integration product manager who builds for scale, not for once.*

Positioning, ten years of platform PM experience shipping standardised, configuration-driven integration products in regulated environments – directly applicable to Riverty's client onboarding mission.

Dear Riverty team,

I am applying for the Product Manager Integration role because the problem you are describing – making client onboarding to a complex platform fast, repeatable, and scalable – is the kind of systems challenge I find most rewarding to work on. Over the past ten years I have spent significant time turning one-off, manually intensive integration processes into standardised, configuration-driven products. That pattern fits what you are building.

At Emil Group I joined a B2B InsurTech platform where every new insurance product was being integrated as a bespoke project, with no shared components and no consistent interface standards between modules. I rebuilt the sprint structure, split an oversized team into focused delivery units, and worked with engineering to define reusable document management, workflow automation, and policy configuration components – directly reducing the time-to-market for new insurance products. The discipline of translating fachliche requirements into platform-level abstractions, rather than per-customer workarounds, is exactly what your job description calls "Drive Standardization."

At Rohde & Schwarz I owned a central data management platform for a multinational defence programme, where I was responsible for ensuring that data ingestion, transformation, and audit pipelines met both ML engineering and regulatory requirements. I delivered end-to-end: user stories, acceptance criteria, implementation support, and GitOps rollout. I also unblocked a long-standing infrastructure problem in OpenShift independently, delivering in one week what engineers had been unable to ship for over a year. That is the kind of ownership I bring to integration work – I do not stop at requirements.

I am fluent in the cross-functional dynamics this role requires. At the Federal Employment Agency I served as deputy IT security officer while simultaneously managing a data analytics

platform across engineering, data science, compliance, and regional government stakeholders. At CLINET Platforms I held client trust together on a mobile healthcare pilot where external API instability was a constant risk, through transparent communication and structured stakeholder workshops. Aligning teams who have different incentives and different vocabularies is something I do by default, not as a special effort.

My German is native, my English is C2, and I work daily with AI-native tooling – not as a curiosity but as a core part of how I run discovery, write requirements, and accelerate prototyping. I bring that into standardisation work too: structured templates, reusable documentation formats, and lightweight tooling to make it easier for customer-facing teams to apply standards consistently.

I would be glad to speak with you about how my background fits the role.

Best regards, *Philipp Hilbert*
