

Philipp Hilbert. *On-chain PM who ships from protocol to consumer.*

Positioning, ten years shipping regulated financial products, now building crypto-native infrastructure from DEX aggregation to DeFi yield, purpose-built for Kraken's hybridisation layer.

Kraken's hybridisation effort is one of the most technically honest problems in consumer crypto right now. Most platforms either bolt a DeFi widget onto a CeFi shell and call it hybrid, or they expose raw protocol complexity and lose everyone below the power-user line. The job description signals that Kraken is trying to do neither: it asks for someone who can shape a genuine onchain roadmap and simultaneously make those experiences simple, intuitive, and accessible. That combination is rare, and it is the one I have been building toward.

My crypto engagement is hands-on and infrastructure-oriented. I actively trade and manage assets across Hyperliquid, Bitget, Jupiter, 1inch and Across Protocol, which means I work daily with perpetual futures, DEX aggregation, cross-chain bridging, and real wallet management. Beyond usage, I study market microstructure: liquidation heatmaps, execution quality, slippage, price impact, and routing logic via Coinglass and Hyblock Capital. I have built my own trading-strategy backtesting engine (phoenix882.com) and a multi-agent coding framework (Liberation of Bajor) that automates end-to-end feature delivery. I am not interested in the token price; I am interested in the systems, incentives, and operational mechanics that make digital asset markets function at scale.

On the product side, I bring a specific track record in exactly the cross-functional complexity Kraken is navigating. At Rohde & Schwarz, I led a multinational AI platform team through competing architectural visions, introduced GitOps delivery that cut rollout time from days to thirty minutes, and redirected the product when instrumented user data showed the beautiful UI was recording zero clicks. At EMIL Group, I restructured an eighteen-person organisation that was losing its senior engineers, cut attrition from near-total to a single departure, and shipped the Claims Center from concept to production with no prior precedent. At Kvitt Payment Solutions, I built a mobile P2P fintech from zero to acquisition by Sparkasse inside the girocard ecosystem. The pattern across all three: complex technical layer, consumer-facing simplicity, and real organisational weight to carry through delivery.

What I do not have is a PM title inside an exchange or protocol team, and I prefer to name that directly rather than obscure it. I compensate with eight years of daily, infrastructure-level crypto engagement and with a career of regulated financial product ownership, payments, insurance, public-sector data, secure encryption, where the stakes of getting the user experience wrong were equally high. The stakeholder management, the roadmap advocacy, the external partner negotiation, the consumer-first product sense: those are transferable, and in my experience they are rarer on a PM résumé than technical fluency.

The onchain economy needs a bridge layer that consumers can trust. Kraken has the brand, the infrastructure, and now the team ambition to build it. I would like to be part of that effort.

Best regards, *Philipp Hilbert*
