Dear UMO team,

I am applying for the Product Manager, Customer Experience role. The problem you are solving, making crypto and fiat feel like one product rather than two apps stapled together, is one I find hard and worth solving.

My crypto background is not theoretical. I have traded across Hyperliquid, Bitget, Jupiter, 1inch, and Across Protocol. I work regularly with liquidation heatmap tools like Coinglass and Hyblock Capital and spend time on market microstructure: slippage, routing, price impact, and custody mechanics. At Polygon I worked on L2 protocol products. I bring 8 years of retail crypto experience and the infrastructure perspective that comes with it, wallets, custody, on-chain transactions, and what first-time users actually find confusing.

On the regulated onboarding side, I have run that problem before. At Kvitt Payment Solutions, the P2P payments product I built was acquired and operated by Sparkasse inside the girocard ecosystem, a tightly regulated environment where every user journey had to pass compliance without killing conversion. At Bundesagentur für Arbeit I served as Deputy IT Security Officer and owned products subject to public-sector data and security requirements. I understand how to design flows that satisfy compliance without punishing the user.

The metric work is there too. At CLINET Platforms I cut a roadmap to the top 10% of features measured against agreed success criteria and user acceptance rose more than fivefold. At Rohde & Schwarz I instrumented two competing product workflows, the beautiful UI-led one recorded zero clicks, and I redirected strategy accordingly, increasing pipeline runs by 200%. I use data to make decisions, not to decorate them. A/B testing, funnel analysis, cohort cuts, these are standard tools in my workflow, not occasional ones.

The AI-augmented workflow requirement in this posting reflects what I already do. I use Claude Code, Cursor, and Lovable daily for research synthesis, spec generation, front-end prototyping, and journey mapping. I also build my own agent frameworks and have a crypto backtesting engine in active development. This is not a selling point I am adding for this application.

I would welcome a conversation about the onboarding and CX challenges UMO is working through right now.

Best regards, *Philipp Hilbert*
