Dear MARGO team,

I am applying for the Data Product Owner role. My background is product ownership on data platforms in regulated industries, labour-market analytics for the Federal Employment Agency, AI and data infrastructure for the FCAS defence programme, and identity and health data platforms at Bundesdruckerei and CLINET.

The role description maps closely to work I have done in each of those engagements. At the Federal Employment Agency I owned a national analytics platform end to end: I gathered requirements from policy analysts and data owners, translated those into user stories and acceptance criteria in Jira, introduced Dagster and dbt to replace manual ETL steps, and cut the time per data update by roughly 75%. Validating data quality and output consistency was a weekly task, not a one-time activity, because the downstream consumers, policymakers and researchers, caught errors in production if we did not catch them first. At Rohde & Schwarz I coordinated a cross-functional team of 15 engineers and data scientists through Scrum, using Jira and Confluence to keep requirements, decisions, and handover documentation in one place.

On the technical side: I use SQL for data investigation regularly, I have shipped ETL pipelines with dbt and Dagster, and I am comfortable working in Azure DevOps environments. I do not have deep daily Databricks or Power BI experience, but I have worked alongside reporting and analytics teams in similar setups and know where the hand-off between data platform and reporting layer sits.

What I find interesting about this role specifically is the combination of Client Data and Sales Strategy Data as the business domains. Those two domains tend to have very different data owners with very different success criteria, and making them share a coherent platform requires the kind of careful requirements work and stakeholder coordination that I have been doing for the past several years.

I would be glad to walk through any of the platform work in more detail.

Best regards, *Philipp Hilbert*
