Dear Manifest team,

I have spent the last thirteen years shipping product in environments where getting the workflow wrong has real consequences: defence AI for a multinational programme, a national labour-market analytics platform used by policymakers, a claims system for insurers, and a mobile patient app in hospitals. In each case the job was the same: turn messy, ambiguous operational reality into clear product direction, then stay close enough to engineering to make sure what ships actually solves the problem. That track record maps directly onto what Manifest's job description calls for, a PM who owns direction and delivery, not just the backlog.

What specifically drew me to this role is the combination of an established booking and payments core alongside a fast-moving AI-native layer. That is not a common architecture, and it creates a genuinely interesting product challenge: the operator workflows in tours and activities are intricate and unforgiving, missed booking, wrong capacity, broken payment, while the AI-native website platform on top needs the kind of zero-to-one speed that tolerates ambiguity. I have operated in both modes. At Rohde & Schwarz I owned an AI and data platform for a multinational engineering programme, running a 15-person cross-functional team through GitOps delivery and cutting rollout time from days to 30 minutes. At CLINET Platforms I took a five-person team facing an undeliverable roadmap, cut it to the highest-value 10 percent, and watched user acceptance rise more than fivefold. Both required the same discipline: agree what success looks like before building, then prove whether it happened.

On the AI-native tooling front, this is not a posture for me, it is how I work. I use Claude Code daily for in-repo exploration and spec generation, Lovable and Framer for rapid prototyping before dev handoff, n8n for agentic workflow design, and Cursor for editing across codebases. In my construct8 side project I built a two-sided B2B2C marketplace from zero using LLM agents to run the full funnel so that one person could operate it. When Manifest's description says PMs are expected to use Claude, Cursor, and v0 to make ideas concrete before implementation, I read that as a description of my default workflow, not a new skill to acquire.

The SaaS platform surface at Manifest, booking flows, ecommerce, payments, accounting, operations, and now AI-native website delivery, is broad, and I understand why you are hiring more than one PM to cover it. My strongest fit is likely where transaction-heavy workflows meet technical depth: booking and payments logic, acceptance criteria for edge cases in complex flows, and collaboration with front-end engineers on interaction details and product polish. I have shipped a Shopware B2B procurement webshop for AOK, owned payment flow architecture at Kvitt (acquired by Sparkasse inside the girocard ecosystem), and designed P2P payment UX at scale. That foundation transfers directly to the operational and ecommerce layers of Manifest's platform.

I would welcome the chance to talk through where my background fits best across the areas you are hiring for. I am available at four weeks' notice and happy to provide references from any of the roles above.

Best regards, *Philipp Hilbert*
