

Philipp Hilbert. *Product Manager, investment lifecycle platform.*

Positioning. Thirteen years owning regulated B2B SaaS products end to end, now applying that depth to AI-powered investment workflows at enterprise scale.

Dear Inception42 Hiring Team,

I am applying for the Product Manager role on InAlpha. The brief resonates with me because it names the hard part directly: owning the roadmap across sourcing and screening, due diligence, investment committee, and portfolio monitoring as one coherent platform, not four separate backlogs. That is a requirements and sequencing problem as much as it is a domain problem, and structured product management is where I spend my working days.

My most relevant parallel is at Rohde & Schwarz, where I owned the internal AI and data platform for the FCAS European defence programme, a cross-functional team of fifteen engineers and data scientists, multinational stakeholders, and a platform that had to meet rigorous security, auditability, and access control conditions before any of the partner nations would accept it. I instrumented competing delivery workflows, redirected strategy based on the evidence, and cut rollout time from days to thirty minutes through GitOps with ArgoCD. The discipline of converting complex professional workflows into prioritised, measurable product requirements under genuine constraint is directly transferable to InAlpha's investment lifecycle context.

At the Bundesagentur für Arbeit I owned a national labour-market analytics platform serving policymakers and researchers, a B2B SaaS data platform with enterprise procurement conditions, regulated data handling, and a user base that could not afford workflow disruption. I integrated ETL automation with Dagster and dbt, reducing time per data update by 75%, and migrated the system from bare metal into containers while carrying a full UI relaunch in parallel. That kind of operational complexity, where data quality and platform reliability are procurement conditions, maps directly onto what institutional investors need from a due diligence and portfolio monitoring tool.

On the AI product side, I have defined expected behavior for AI-driven features in production environments, including grounding, citation handling, and failure modes where source material is incomplete. At CLINET Platforms I owned a mobile patient application where the integration into hospital information systems had to be both accurate and auditable; at Qcrypt AG I owned a quantum-secure encryption product where the security properties had to be verifiable, not assumed. Both sharpened my instinct for the difference between features that work in demos and features that hold under institutional scrutiny.

The InAlpha role asks for someone who can bring commercial reasoning into prioritisation, weighing pipeline impact, renewal risk, and delivery cost alongside user value. I have done this from both the product and the founder side: Kvitt Payment Solutions was acquired by Sparkasse and integrated into the girocard ecosystem, which required connecting product decisions to commercial outcomes at every stage. I am ready to relocate to Abu Dhabi and contribute from day one in an execution-focused environment.

Best regards, *Philipp Hilbert*
