Dear Hiring Team at Miral Destinations,

Yas Island's ambition is to be a destination that guests return to, not just visit once. The mobile app is the connective tissue for that ambition: it has to hold bookings, surface real-time park information, and create moments that turn a first visit into a habit. That is a delivery problem before it is a design problem, and delivery is where I spend my time.

I have been owning product backlogs and running agile ceremonies for thirteen years across regulated and complex environments, defence AI platforms, public-sector analytics, insurance SaaS, healthcare mobile apps, and fintech. At CLINET Platforms I took a clinical iOS and Android patient app with a five-person team and a roadmap nobody could deliver, cut it to the features that moved the agreed metrics, and got user acceptance up more than fivefold in a single cycle. At Rohde & Schwarz I ran a cross-functional team of fifteen engineers and data scientists through Scrum in Jira and Confluence, shipping a platform that went from days-long rollout cycles to thirty-minute GitOps deployments. The pattern in both cases was the same: clear user stories, acceptance criteria engineering can build against without ambiguity, and sprint discipline that keeps stakeholders informed rather than surprised.

The Miral posting calls out App Store and Play Store submissions, release version management, bug triage and hotfix coordination alongside Firebase, GA4 and AppsFlyer analytics, and comfortable stakeholder management across marketing, ops, engineering and external vendors. That exact combination is what I ran at CLINET, where hospital information-system integrations, clinical compliance, and a tight release cadence all had to coexist. I am comfortable with the operational side of mobile delivery because I have lived it as the person who had to write the release notes, file the store submission, and explain the delay to the clinical sponsor in the same week.

At Scheidt & Bachmann I worked inside a fully structured SAFe environment, agile release trains, PI planning, the whole framework, which maps directly to the formal agile certification the posting requires. I hold a PSPO and have run the ceremonies, not just attended them.

What draws me specifically to Miral is the scale and integration complexity: a guest app that has to coordinate ticketing, bookings, loyalty, and real-time park operations across a multi-brand destination is a genuinely interesting delivery problem. The constraint of making it feel effortless on a guest's phone while the back-end spans multiple platforms is exactly the kind of challenge I do my best work on. I would be glad to talk through how I would approach the first sprint cycle and the App Store release pipeline in a conversation.

Best regards, *Philipp Hilbert*
