

Philipp Hilbert. *On-chain Product Manager, crypto-native.*

Positioning, ten years shipping regulated data products, eight years deep in DeFi and on-chain market infrastructure, now focused on building the best on-chain data products in the industry.

Dear CoinMarketCap Team,

I am applying for the Senior Product Manager, On-chain role. CoinMarketCap is where the crypto industry goes to answer the question "is this real?" and the on-chain product line is now the most demanding front in that mission: DEX volumes are breaking records, multi-chain activity is fragmenting data across dozens of execution environments, and the gap between raw on-chain event data and genuinely useful product experience is still enormous. I want to close that gap.

My crypto depth is hands-on and infrastructure-oriented. I actively trade and manage assets across Hyperliquid, Bitget, Jupiter, 1inch, and Across Protocol, working with perpetual futures, spot, DEX aggregation, and cross-chain bridging as a daily practitioner. I use Coinglass and Hyblock Capital to analyse liquidation heatmaps and market microstructure, and I am building a personal backtesting engine in Python that models slippage, price impact, and routing as first-class execution variables, not simplifications. Eight years as a DeFi and crypto market participant, including L2 work at Polygon, means I arrive with a genuine user's perspective on what on-chain data products get right and, more usefully, what they consistently get wrong.

On the product side, I bring thirteen years of shipping in regulated, data-heavy environments. At Rohde & Schwarz I owned an internal AI and data platform, led a cross-functional team of fifteen-plus engineers and data scientists, and redirected strategy based on instrumented workflow analysis, identifying that a well-designed UI was recording zero usage while developer-code-first tooling drove a 200 percent increase in pipeline runs. At the Bundesagentur für Arbeit I introduced Dagster and dbt into a national labour-market analytics platform, cutting data-update time by 75 percent and enabling quarterly indicator refreshes without manual intervention. These are exactly the kinds of ETL, data modelling, and analytics platform problems that sit under every serious on-chain data product. I know how to write clear user stories for complex data pipelines, align data engineers and business stakeholders around a single roadmap, and evaluate what I ship against agreed metrics rather than output volume.

The immediate product challenge as I read the posting is twofold: improving the in-house infrastructure that parses and organises on-chain data, and building the user-facing layer that makes that data actionable, for traders evaluating DEX liquidity, for researchers studying MEV and slippage, for developers integrating CMC data into their own tools. I have shipped in both layers. I know the difference between a data model that is technically correct and one that maps to how users actually reason about on-chain activity, and I know how to use qualitative discovery and quantitative instrumentation together to find that gap before it becomes expensive.

I would welcome the opportunity to discuss what the on-chain roadmap looks like from the inside and where the biggest open problems are. I am available at short notice and happy to work in whatever timezone suits the team.

Best regards, *Philipp Hilbert*
