Dear Bybit Hiring Team,

I am applying for the Product Manager role at Bybit. With 13 years of product ownership across regulated, high-complexity environments, defence AI, public-sector analytics, insurance, fintech, and healthcare, I have spent my career doing precisely what this posting describes: translating ambiguous business problems into clear, scalable product solutions and driving them through cross-functional teams to measurable outcomes.

My crypto engagement runs deeper than most PM candidates can honestly claim. I actively trade and manage positions across CEX and DEX venues including Hyperliquid, Bitget, Jupiter, and 1inch, working with perpetual futures, spot markets, DEX aggregation, and cross-chain bridging on a daily basis. I analyse market microstructure using liquidation heatmaps and platforms such as Coinglass and Hyblock Capital, and I am building my own backtesting engine and algorithmic trading tools. I understand the infrastructure layer, stablecoins, custody, exchange connectivity, execution quality, not just the price action. That means I can write product requirements for Bybit's trading and platform features from the perspective of an informed power user, not a generalist approximating the domain.

On the execution side, I have owned the full product lifecycle in environments that are directly analogous to Bybit's. At Rohde & Schwarz I led an AI and data platform serving multinational engineering teams, managing 15+ engineers and data scientists through Scrum, cutting rollout time from days to 30 minutes via GitOps, and redirecting strategy mid-cycle based on instrumented workflow data. At the Bundesagentur für Arbeit I owned a national analytics platform as a one-person PM function, migrated the system to containers, and reduced data update time by 75% by introducing Dagster and dbt. Both roles required the same skills Bybit lists: writing and owning MRDs and PRDs, defining success metrics up front, managing dependencies and stakeholder expectations simultaneously, and reporting clearly to leadership when priorities needed to shift.

I am also an AI-native practitioner. I use Claude Code, GitHub Copilot, Cursor, and Lovable daily, not as conversation topics but as tools that accelerate requirements work, prototype exploration, and edge-case discovery. I have built multi-agent automation workflows in n8n and shipped a solo two-sided marketplace (construct8) where LLM agents run the operational funnel. Bybit's stated interest in AI-enabled product development and intelligent workflows is not a future ambition for me; it is my current working method.

The role asks for someone with professional English fluency; for reference, a recorded English presentation for one of my own ventures is available at youtube.com/watch?v=nt06f71lgfE.

I am available at four weeks' notice, hold EU citizenship with no visa requirements, and am open to the remote arrangement this role supports. I would welcome a conversation about how my background fits Bybit's current product priorities.

Best regards, *Philipp Hilbert*
