Dear Hiring Team,

I am writing to apply for the AI Product Manager role at the fintech company you are representing. Ten years of product management in regulated industries, fintech, insurance, defence AI, and public sector, combined with hands-on AI product delivery gives me a specific kind of fit with what you have described.

The role asks for someone who can sit at the intersection of engineering, data science, compliance, and commercial strategy. That is a fair description of what I have done across several organisations. At the Federal Employment Agency I owned a national labour-market analytics platform, served as Deputy IT Security Officer, integrated test automation into the Jenkins pipeline, introduced Dagster and dbt for ETL, and drove a full bare-metal-to-container migration, all at the same time, inside a public-sector governance framework. At Rohde & Schwarz I managed a cross-functional team of fifteen engineers and data scientists building an AI and data platform for the FCAS European defence programme, introduced GitOps rollout with ArgoCD that cut deployment time from days to thirty minutes, and redirected strategy based on instrumented workflow analysis that revealed the UI-first approach had recorded exactly zero clicks in production. Both roles required translating what is technically feasible into something that would survive compliance and regulatory scrutiny.

The fintech thread runs through my career as a founder and as a practitioner. I built Kvitt Payment Solutions, a mobile P2P payments product, from zero to acquisition by Sparkasse, operating inside the girocard ecosystem. That experience taught me how regulated payment infrastructure actually behaves under pressure, which is different from how it reads in a specification. The AI governance and model risk requirements you mention are areas I have worked in explicitly: EU AI Act compliance, Explainable AI design, human-in-the-loop workflows, and audit-trail architecture for AI outputs. I understand why a fintech team would treat these as first-class product requirements rather than a legal checkbox.

I move quickly and I am comfortable with ambiguity. At CLINET Platforms I inherited a roadmap a five-person team could not deliver; I cut it to the top ten percent of features against agreed success measures and user acceptance rose more than fivefold. At EMIL Group I restructured an eighteen-person organisation that was losing its senior engineers, shipped a Claims Center from concept to production with no precedent, and cut time-to-market for a new insurance product from months to under a week. These outcomes happened because I treat prioritisation as a discipline and success metrics as a contract, not a post-launch formality.

If you would like to discuss how my background maps to the specific AI features your client is building, I am available immediately.

Best regards, *Philipp Hilbert*
