Dear Hiring Team,

I am writing to apply for the Senior Product Manager, Financial Services & AI-Enabled Products role. My background spans 13 years of product ownership across payments, insurance, regulated government data platforms, and defence AI infrastructure, and I am actively targeting the UAE market. I am prepared to relocate to Abu Dhabi and work fully on-site.

The framing of this role is one I recognise immediately: this is a financial services product leadership position where AI competency is now table stakes, not the headline. That is exactly how I approach the work. At EMIL Group I owned a B2B SaaS platform serving insurers, reinsurers, brokers, and underwriters, a regulated, multi-stakeholder environment where product decisions had compliance and contractual consequences. I shipped the Claims Center from concept to production with no prior template, restructured an 18-person delivery organisation that was losing senior engineers, and reduced attrition from near-total exodus to a single departure. Before that, at Bundesagentur für Arbeit, I served concurrently as Deputy IT Security Officer while owning a national labour-market analytics platform used by policymakers and researchers, a role that required simultaneous credibility with regulators, engineering, and executive stakeholders.

On payments specifically: I co-founded Kvitt Payment Solutions, a mobile P2P group payments product built inside the girocard ecosystem and ultimately acquired and operated by Sparkasse. I understand payment flows, transaction lifecycles, settlement mechanics, and the operational controls that regulated payment infrastructure requires, not from a distance, but from having designed and owned those product decisions from zero.

My AI capability is practical rather than theoretical. At Rohde & Schwarz I owned an internal AI and data platform for the FCAS European programme, managing 15+ engineers and data scientists. I used workflow instrumentation to redirect product strategy, a UI-led approach recorded exactly zero clicks; a developer-code-first approach increased pipeline runs by 200%. That is the discipline I bring to applying AI inside financial products: evaluating actual workflow impact rather than retrofitting AI features. In my own work I use Claude Code, GitHub Copilot, Cursor, n8n, and Lovable daily to accelerate discovery, specification, and prototyping.

The profile the posting describes, deep payments and banking domain knowledge, strong product fundamentals, technical credibility with engineering, and grounded AI execution, is not a combination I am building toward. It is what I have done. I would welcome a conversation about the specific product area this role will initially own and the regulatory environment it operates in.

Best regards, *Philipp Hilbert*
