Dear Hiring Team,

I am applying for the Global Technical Product Owner, Enterprise AI, Data & Cybersecurity role. My career has been built in exactly the intersection this posting describes: regulated-industry product ownership, technical data platform delivery, and security product management, now extended into enterprise GenAI and agentic AI.

At Rohde & Schwarz I led the AI and data platform for the FCAS European defence programme, a cross-functional team of 15+ engineers and data scientists building infrastructure where data provenance, audit trails, and responsible AI use were not optional features but programme requirements. I introduced GitOps delivery with ArgoCD, cutting rollout time from days to 30 minutes, and redirected product strategy based on instrumented workflow analysis that produced a 200% increase in pipeline runs. This is the kind of evidence-driven platform ownership the role calls for.

At Bundesagentur für Arbeit, I served as Deputy IT Security Officer while simultaneously owning an ETL-heavy national labour-market analytics platform. I introduced Dagster and dbt to automate quarterly data imports and new indicator onboarding, saving approximately 75% of the time per data update, and carried a full bare-metal-to-container migration through the same period. Working under public-sector data governance and security obligations taught me how to treat compliance constraints as architecture inputs rather than afterthoughts, a disposition that transfers directly to banking-grade AI governed systems.

The role's emphasis on LLMs, RAG, GraphRAG, and agentic AI evaluation frameworks aligns with how I work today. I build with Claude Code, GitHub Copilot, Cursor, n8n, and Lovable daily, and I have designed agentic workflow loops with human-in-the-loop gates and prompt-based evaluation. At my own venture, construct8, I built an LLM-agent-driven two-sided marketplace from zero to one, not as a prototype, but as the operating layer of the business. I understand both the promise and the failure modes of agentic systems, which is the prerequisite for writing useful guardrails and observability requirements.

On the cybersecurity side: I co-founded Qcrypt AG and owned the product architecture for quantum-resistant encryption hardware and software targeting enterprise buyers. I understand attack surface reasoning, sensitive-data controls, and how to translate security requirements into product decisions that engineers can actually implement.

Abu Dhabi is a location I have actively targeted. Relocation is not a compromise; it is the plan.

Best regards, *Philipp Hilbert*
