

Philipp Hilbert. *Consumer crypto trading PM, retail-first.*

Positioning, ten years shipping regulated financial and platform products, now focused on consumer crypto trading where market intuition and product rigour combine.

Dear Crypto.com Hiring Team,

I am applying for the Senior Product Manager, Trading (Crypto.com App) role. I have spent the last decade shipping regulated financial and platform products, from a P2P payments app acquired into the Sparkasse girocard ecosystem to a B2B insurance SaaS platform, a national labour-market analytics platform, and an AI data platform for a multinational defence programme. Throughout, the common thread has been turning complex, constraint-heavy domains into products that real users actually complete workflows in. Consumer crypto trading is the domain where that skill set feels most naturally applied.

My crypto engagement goes well beyond casual interest. I actively trade across centralised and decentralised venues, Hyperliquid, Bitget, Jupiter, 1inch, Across Protocol, and I spend serious time studying execution quality: slippage, price impact, routing, liquidation mechanics, and market microstructure via Coinglass and Hyblock Capital. I have built a personal backtesting engine and am developing trading bots. This means I understand the gap between what a retail trading UI shows a user and what is actually happening at the infrastructure layer, which is exactly the gap a strong trading PM needs to close when writing specs for order flow, risk controls, and portfolio display.

Crypto.com's scale, 80 million customers, a global regulatory footprint, and a product surface that must balance retail UX with execution integrity, is the kind of environment where I do my best work. At EMIL Group I restructured an 18-person delivery organisation that was hemorrhaging engineers and client trust into three lean teams with their own leads; attrition fell to near zero and we shipped the Claims Center from concept to production. At Rohde & Schwarz I redirected product strategy after instrumenting two competing workflows and discovered the "beautiful" UI-led design had recorded exactly zero clicks, pipeline runs then increased 200% after pivoting to the approach the data supported. Both stories are about the same discipline: making expensive decisions cheaper by measuring before committing.

The posting calls for domain knowledge in retail trading or gamification. I bring the trading side with depth. Gamification mechanics, streaks, milestones, reward loops, are something I understand from adjacent work on engagement and retention in consumer products, and from years as a semi-professional poker player who has used and critiqued training software, HUD tooling, and hand-history analytics at a serious level. Engagement design that respects the user's financial risk is a different problem than engagement design in a casual game, and I think Crypto.com is right to treat it as such.

My AI-native workflow is operational, not aspirational: I use Claude Code, Cursor, GitHub Copilot, and Lovable daily to prototype, generate specs, stress-test edge cases, and accelerate engineering handoffs. This is the human-in-the-loop practice the posting requires, already running at my desk.

I would welcome the chance to talk through how my background maps to the trading squad's current priorities.

Best regards, *Philipp Hilbert*
