Dear EnopAI team,

The combination you are looking for – a Product Owner who can read a Postman payload, run a customer discovery interview in fluent German, and make a hard prioritisation call without hiding behind process – is not common. I have spent nearly a decade building exactly that profile across AI data platforms, InsurTech SaaS, public data infrastructure, and founder-level company building. I would like to put it to work on what you are building.

What draws me to EnopAI specifically is the operational complexity underneath the product. Optimising across PV generation, battery state, EV load, and grid constraints in real time, with heterogeneous hardware and cloud-to-cloud integrations, is a genuinely hard systems problem. That is the kind of environment where being technically fluent pays off daily – not because the PO needs to write the optimisation algorithm, but because understanding what an endpoint returns, why a payload is malformed, or what a data stream latency means for a feature's feasibility changes the quality of every decision made in refinement.

At Rohde & Schwarz, I owned a data management platform for the FCAS defence programme. The tech stack – Kubernetes, Argo Workflows, OpenShift, Redpanda – was demanding, and the stakeholder map was multinational and risk-averse. I delivered autonomous feature sets end-to-end, reduced deployment cycles from days to under forty minutes via GitOps, and unblocked an infrastructure issue the project lead had been waiting on for over a year by solving it directly in one week. At the Federal Employment Agency, I served as Deputy IT Security Officer while managing a public analytics platform migration to Kubernetes and introducing Dagster for automated ETL – which required holding both the data science and the political stakeholder relationships simultaneously. At Emil Group, I walked into a broken team, split a seventeen-person Scrum blob into functioning units, and rebuilt client trust in a prototype-stage InsurTech

environment through structured weekly workshops and honest communication about what was and was not possible.

I do not have background in energy trading or battery management systems. I want to be direct about that. What I do have is a repeatable pattern: arrive in a technically complex domain, build genuine understanding fast through structured discovery and engineering collaboration, and start making useful product decisions within weeks rather than months. The energy transition context is also not abstract to me – I understand at a system level why real-time optimisation across distributed assets matters, and I find the problem genuinely worth working on.

I am based in Berlin and explicitly open to relocating to Munich, which is where your office is. I am available to start within four weeks of an offer. I would welcome a conversation about where the product is today, what the biggest open questions are on the roadmap, and how I can contribute from day one.

Best regards, *Philipp Hilbert*
