

Philipp Hilbert. *Senior PM built for AI-native B2B SaaS.*

Positioning, ten years translating complex workflows into scalable products, now applying that foundation inside a company where AI is the core product, not the afterthought.

I am applying for the Senior Product Manager role at your company because the description maps almost exactly onto the mode of product work I have spent ten years refining: B2B SaaS, close client proximity, AI as the operating environment rather than the subject of a roadmap item, and communication as the load-bearing skill.

At Emil Group I joined an InsurTech SaaS platform mid-crisis. A 17-person team had lost delivery rhythm, client trust was eroding, and the team was on the verge of losing its most senior engineers. I split the team into smaller Scrum units, reintroduced velocity tracking and structured refinement, and ran weekly product workshops with clients directly. Senior developer attrition dropped from near-total to a single departure. The platform – which had been collapsing under its own weight – stabilised and began shipping again. That work was almost entirely about communication and product clarity under pressure, which is precisely what the role description leads with.

At Rohde & Schwarz I ran the product for a central AI and data management platform inside the European defence programme FCAS. The environment was technically complex – multimodal datasets, Kubernetes orchestration, GitOps pipelines, a multinational stakeholder structure – and the mandate was to make AI training data trustworthy and auditable. I delivered autonomous feature sets end-to-end, reduced deployment times from several days to under 40 minutes by introducing ArgoCD-based GitOps, and unblocked an infrastructure problem the project lead had been requesting from engineers for over a year. I solved it in one week. That is what AI-native product execution looks like in practice: not prompting a model to write a spec, but understanding the full stack well enough to close the loop yourself.

I have been using AI tooling daily for several years now – Claude Code for in-repo refactors, GitHub Copilot for development, n8n for multi-agent workflow automation, Lovable for rapid prototyping, Framer for design work. These are not tools I list; they are the environment I

operate in. A company that describes an AI environment as "normal" is describing my default setting, not a stretch goal.

The travel requirement to the US and company-wide events is not a constraint for me. I have worked across multinational programmes and with distributed client bases. Showing up in person, building trust in the room, and then maintaining it remotely is a workflow I know well. I am an EU citizen, fluent in English at C2, and available within four weeks of an offer.

I would welcome a call to discuss the product challenges your clients are facing and where my background fits most directly.

Best regards, *Philipp Hilbert*
