Dear Bjak team,

I have been following Bjak's expansion from insurance into payments and savings with real interest. The move from a single-product insurance platform into a full AI neobank is exactly the kind of scope problem I have worked on across multiple companies, and I want to help you execute it.

My most directly relevant work is at EMIL Group, where I owned a B2B SaaS platform for insurers and reinsurers. The team was losing engineers and client trust at the same time. I restructured delivery, shipped the Claims Center from concept to production, and cut time-to-market for a new insurance product from months to under a week. Before that, I built Kvitt Payment Solutions, a mobile P2P payments product that was acquired and operated by Sparkasse inside the girocard ecosystem. Those two experiences, insurance platform product ownership and payments from zero to acquisition, map directly to the product areas this role covers.

The posting asks for someone who starts from user problems, not feature lists, and who is honest about what changed because of their work versus wider team effort. At Bundesagentur für Arbeit I redirected an ETL platform based on instrumented workflow analysis and saved nearly 75% of time per data update. At Rohde & Schwarz I increased pipeline runs by 200% by deprioritising a UI nobody was clicking in favour of developer-first tooling. Both improvements came from measuring first, not from assumptions.

On the AI side, I run a daily workflow across Claude Code, GitHub Copilot, Lovable and Cursor. I use LLM agents in production, my construct8 marketplace runs its day-to-day operations through n8n-based agent automation. That is the kind of AI-native execution Bjak's neobank app will need as it scales into new financial service verticals.

I am based in Berlin, authorised to work in Germany, and available within four weeks.

Best regards, *Philipp Hilbert*
