Dear Unibuild Garage team,

The role you have posted is rare: not a product manager who manages a roadmap inside a functioning organisation, but a Product Lead who works directly with a founder to bring order to a large, multi-module platform before too much has been built in the wrong direction. That framing resonated immediately, because it describes a problem I have solved more than once.

At EMIL Group I joined an 18-person delivery organisation that was losing its senior engineers and its client trust simultaneously. The immediate task was not to write better PRDs, it was to understand which parts of the system were entangled in ways that made everything hard, restructure around that reality, and then ship the Claims Center from concept to production with no prior precedent. Time-to-market for a new insurance product fell from many months to under a week. That kind of result comes from treating the product definition as load-bearing infrastructure, not as documentation. At Bundesagentur für Arbeit I owned a national labour-market analytics platform where the platform, payments flows, data pipelines and user-facing surface all had to be kept aligned across a geographically distributed team, the kind of cross-module coordination Unibuild's combined marketplace, provider OS and ERP/finance layer will require continuously.

My own company, construct8, is the most direct evidence for this role. I built a two-sided B2B SaaS marketplace from zero, alone, for the construction staffing market. I designed the anonymity-until-payment model that protects both sides, used WhatsApp and Telegram as the product surface to minimise onboarding friction, and wired LLM agents across the matching funnel so the platform operates with minimal manual intervention. The gaps I had to close, role definitions, permission logic, workflow states, notification triggers, edge cases in the payment release flow, are exactly the gaps the posting describes. I closed them without a product team, which means I can also close them with one.

On the B2B SaaS and payments side: at Kvitt Payment Solutions I built a mobile P2P group payments product from zero to acquisition by Sparkasse, operating inside the girocard ecosystem. At Scheidt and Bachmann I owned POS and forecourt payment integrations in a fully SAFe setup. At AOK ITSCare I migrated a procurement e-commerce platform to Shopware for three insurers and roughly 20,000 employees. FinTech, payments, and e-commerce are not adjacent domains for me, they are where I have shipped.

The practical case study you mention for shortlisted candidates is the kind of filter I welcome. I am happy to take it on, and to share the full product blueprint documentation from construct8 as a concrete example of how I structure a complex platform from scratch. Please share examples of products where you personally owned product definition and delivery, I look forward to doing exactly that.

Best regards, *Philipp Hilbert*
