

Philipp Hilbert. *Lead Product Manager, B2C Consumer Platforms.*

Positioning, 13 years owning end-to-end product in regulated, high-stakes environments, now ready to bring that rigour to a fast-scaling consumer platform in the Middle East.

Dear Hiring Team,

The brief Talent Seed has shared describes something specific: a consumer platform that has decided it wants to grow up. Smaller teams, senior ownership, continuous discovery, outcome-based roadmaps, these are not slogans in your description, they are design decisions. That matters, because the organisations where I have done my best work were ones that had chosen to change how they built product, not just what they built.

My most direct parallel is the period at Rohde & Schwarz, where I joined a multinational AI data platform mid-build and found a delivery process that could not carry a hotfix without a multi-day rollout. I introduced GitOps with ArgoCD, cut rollout time from days to 30 minutes, and simultaneously redirected the entire product direction after instrumentation showed that the UI-led workflow nobody actually used was consuming the majority of engineering effort. Neither fix was dramatic; both required gaining the trust of architects, data scientists, and engineers across three countries and then using evidence rather than authority to change the course. Earlier, at EMIL Group, I inherited an 18-person delivery organisation in which the senior engineers were leaving. I restructured it into three lean teams with their own leads, and attrition fell to a single departure. These are the mechanics your brief describes needing.

On the consumer side, my clearest ownership is Kvitt Payment Solutions, a mobile P2P group-payment product I built from zero and took to acquisition by Sparkasse inside the girocard ecosystem. More recently I built construct8, a two-sided construction staffing marketplace, alone, using LLM agents across the sourcing and qualification funnel so the platform could operate with minimal overhead. The activation, engagement, and trust mechanics in a two-sided consumer marketplace are precisely the problem space your posting describes: who activates, who goes dormant, what triggers repeat usage, and where the commercial levers sit.

I am comfortable in the data layer beneath those questions. At the Federal Employment Agency I owned a national analytics platform for policymakers and researchers, introduced Dagster and dbt to make quarterly data imports autonomous, and ran as Deputy IT Security Officer simultaneously. I can build and run queries, design dashboards, define the KPIs that matter, and distinguish a real retention signal from noise in the data. I use AI-assisted prototyping tools, Lovable, Claude Code, Cursor, daily, not aspirationally, and I can put a working prototype in front of users before the sprint review.

The Middle East market is new geography for me, and I say that plainly. What I bring is a method that works regardless of market: start with genuine customer discovery, frame problems before solutions, run cheap experiments before large bets, and keep the commercial and the customer lens in the same room. If the platform is undergoing the transformation your brief describes, that method is the contribution. I would welcome the conversation.

Best regards, *Philipp Hilbert*
