Dear Hiring Team,

Deel IT's problem is specific and the brief is honest about it: two platforms that handle real scale already exist, and what is missing is the judgment to automate the manual workflows that live on top of them and to unlock what suppliers can actually do. That is a systems problem, not a backlog-grooming problem. It is the kind of work I have spent the past decade doing in regulated, high-stakes operational environments.

At Rohde & Schwarz I inherited a multinational AI and data platform where rollout took days and could not carry a hotfix. I introduced GitOps delivery with ArgoCD, cut rollout time to thirty minutes, and made the platform hotfix-capable, without disrupting ongoing delivery. At the Bundesagentur für Arbeit I integrated test automation into the Jenkins pipeline, introduced Dagster and dbt so quarterly data imports ran without hand-holding, and migrated the platform fully into containers, putting the team in autonomous control of its own environments. Both roles required the same motion: map the whole system, find where human effort is replacing platform capability, and remove the human from the loop one workflow at a time.

The supplier expansion opportunity resonates directly with work I did at EMIL Group, where I rebuilt an 18-person delivery organisation into three lean teams with their own leads after it had been losing senior engineers and client trust. The pattern is the same: an external party (there, a client; here, a supplier network) wants to do more and is being held back by internal structure. The answer is rarely a feature, it is figuring out which constraint is real and which is just accumulated friction.

On AI as a daily working mode: I use Claude Code, GitHub Copilot, Cursor, Lovable, and n8n actively, not as experiments. I build agentic workflows, write and run prompts to synthesise unstructured operational data, and prototype front-ends fast enough to validate assumptions before writing a requirements document. I also built my own multi-agent coding framework (Liberation of Bajor) and a backtesting engine, which means I understand the infrastructure constraints that agentic systems run into at scale.

The logistics depth comes from two directions: a Master's specialisation at TU Berlin and the practical reality of building Kvitt Payment Solutions from zero to acquisition inside the girocard ecosystem, where payment rails and operational logistics are the same thing. I am not a logistics veteran, but I am not starting from a blank page either.

I would welcome the chance to talk through the specific automation roadmap priorities and where an experienced systems thinker would add the most leverage in the first ninety days.

Best regards, *Philipp Hilbert*
