Dear Kraken team,

Kraken Pro's onboarding challenge is specific: get a trader who already has intent across the line to a first trade, fast, without losing their trust at the friction points that make them leave. I have owned versions of this problem before, not in crypto, but in contexts where the stakes of dropping off were just as high and the margin for error was just as thin.

At CLINET Platforms I inherited a five-person team trying to ship a roadmap three times too long. I cut it to the top 10% of features against agreed success measures and user acceptance rose more than fivefold. At EMIL Group I shipped the Claims Center from concept to production in a period when the organisation was actively losing senior engineers. In both cases the job was the same: find the moment where value is actually delivered, remove everything blocking it, and measure whether it happened.

I am an active crypto trader and have been for eight years. I use Kraken Pro, Hyperliquid, Jupiter, 1inch, and Across Protocol regularly. I work with liquidation heatmaps on Coinglass and Hyblock Capital. I understand perpetual futures, spot execution, DEX aggregation, and cross-chain mechanics from the inside. When I look at the Pro onboarding funnel, I am not guessing at what a trader needs, I am one.

On the AI side: I use Claude Code, Cursor, GitHub Copilot, Lovable, and n8n in my daily workflow, not as experiments but as production tools. I build agentic workflows for funnel automation, use AI to surface friction points in data, and prototype features in Lovable before taking them to engineering. The posting asks for fluency with AI tools to analyse data, personalise experiences, and speed up how a PM works. That describes how I already work.

I am based in Berlin, available remotely, and can start within four weeks.

Best regards, *Philipp Hilbert*
