Dear Hiring Team,

I am applying for the Product Manager role at Uniware Systems. I have spent 13 years owning product in regulated B2B environments, including payments, healthcare, insurance and public-sector data platforms. Payments and POS are not new territory for me: I founded Kvitt Payment Solutions, a mobile P2P payment product built inside the girocard ecosystem and later acquired by Sparkasse, and I have spent years working with payment flows, PSP integration and the kind of operational edge cases that only surface at scale.

The thing that caught my attention in this posting is the AI-DLC framing. Most organisations talk about AI as a feature to build; Uniware is treating it as a delivery method across discovery, definition and construction. That is a difference, and it matches how I already work. At Rohde & Schwarz I used workflow instrumentation to kill a UI-first strategy that had zero real usage, then redirected the team toward a developer-first approach that tripled pipeline runs. At the Bundesagentur für Arbeit I introduced Dagster and dbt into a quarterly data pipeline and cut the time per update by 75%. I use Claude Code, Copilot and Lovable daily, not occasionally.

Your customer base spans universities, financial institutions and motorway services: institutional buyers with real operational stakes and low tolerance for unreliable software. I know that environment. At CLINET Platforms I cut a five-person team's roadmap to the top 10% of features against agreed success measures and user acceptance rose more than fivefold. At EMIL Group I restructured an 18-person delivery organisation that was losing its senior engineers and its client trust: attrition dropped to a single departure and the teams shipped the Claims Center from concept to production. These were not smooth runs, and I did not manage them from a distance.

On the Early Adopter side: I understand why that programme exists and how to run it well. Feedback gathered after a wide launch is too late to be useful. The Bundesagentur role taught me to set specific success measures before construction and check them honestly afterwards, including the uncomfortable cases where the numbers said we were wrong.

I would be glad to talk through how my experience maps to the Uniware portfolio.

Best regards, *Philipp Hilbert*
