Dear Vesta Software Group team,

I have 13 years of product ownership across regulated B2B software, including payments, insurance, healthcare, public-sector analytics and defence. Across those roles the common thread has been taking products from structured discovery through to customer adoption, not stopping at release or handoff, but staying in the loop through launch, Early Adopter feedback and the corrections that follow. That matches what Uniware describes for this role directly.

The payments and EPoS domain is familiar ground. I founded Kvitt Payment Solutions, a mobile P2P group-payments product that was acquired and operated by Sparkasse within the girocard ecosystem. I have also worked on POS and forecourt systems at Scheidt & Bachmann, where I moved research results into production in a fully SAFE setup. I understand how payments products behave differently from pure software, the edge cases, the compliance dependencies, the operational requirements that live alongside the UX ones.

On the AI-DLC piece: I use AI tools daily in product work. At Rohde & Schwarz I used Claude Code and GitHub Copilot to accelerate requirements drafting and edge-case generation on an internal AI and data platform. At construct8 I ran LLM agents across a two-sided marketplace funnel so a single person could operate the day-to-day. The tools I use include Claude Code, Cursor, Lovable, GPT and Gamma.app. I have also thought about where human review has to stay in the loop, particularly on requirements and acceptance criteria, where AI can draft but cannot own the decision.

At CLINET Platforms I inherited a five-person team with a roadmap it could not deliver. I cut it to the top 10% of features against agreed success measures, and user acceptance rose more than fivefold. At EMIL Group I restructured an 18-person delivery organisation that was losing engineers and client trust into three focused teams: attrition dropped from near-total exodus to a single departure. I raise those examples because Uniware's job description is clear that this role is about product outcomes, not backlog management, and that orientation is how I approach the work.

I would welcome a conversation about the role and about where Uniware is in its AI-DLC adoption.

Best regards, *Philipp Hilbert*
