Dear Rithum team,

I am applying for the Technical Product Manager role. I have 13 years of product ownership, mostly in integration-heavy B2B environments: a payments platform acquired into the Sparkasse girocard ecosystem, an insurance SaaS serving reinsurers and brokers, a national labour-market analytics platform for policymakers, and a B2B procurement webshop built on Shopware for three AOK health insurers. The common thread across those roles is translating ambiguous operational requirements into precise user stories and acceptance criteria, then driving cross-functional teams through delivery.

The Rithum posting is specific about what the role requires day to day: intake and triage rhythms, end-to-end ownership from requirements through release notes and enablement materials, and close collaboration with engineering and data science on APIs and data workflows. At Bundesagentur für Arbeit I owned a national analytics platform where I introduced Dagster and dbt to replace manual quarterly imports, saving roughly 75% of the time per data update, and integrated test automation into the Jenkins pipeline to free QA capacity. At EMIL Group I shipped the Claims Center from concept to production while restructuring an 18-person delivery organisation that was losing engineers and client trust. Both required the same thing: clear written outputs, early risk surfacing, and consistent cross-functional alignment.

The e-commerce and platform signal in the posting is relevant to my background. I ran the Shopware migration for AOK ITSCare, covering three insurers and roughly 20,000 employees, from backlog refinement and user stories through acceptance criteria in Jira. That system is still in production. I understand the mechanics of integration-heavy platforms, including REST APIs, webhooks, authentication patterns, and payload design, and I read technical documentation as a routine part of scoping.

I use AI tooling the way the posting describes: Claude Code and GitHub Copilot for documentation and requirements drafts, GPT for data analysis and communication, Lovable for rapid prototyping, and n8n for agentic workflows. That is not a list I assembled for this application. It is how I have been working for the last two years.

I am based in Berlin, hold EU citizenship, and am available within four weeks. I would be glad to talk through how my background fits the platform and the team.

Best regards, *Philipp Hilbert*
